

DEAD-LEG ADAPTER

Product Data Sheet

The Dead-Leg Adapter allows the safe resumption of temporary service when one leg of a 120/240 volt service is dead due to events such as storm damage or faulted underground service cable.

APPLICATIONS

By removing the fuse from the faulted leg side and placing it across the load side lugs 120 volts will be provided to each side of the service. Since these two phases now have the same potential, 240 volt appliances will not operate while this temporary device is installed.

FEATURES

- Safely provided full 120 volt service.
- Movable 110 amp, 200,000 AIC fuses.
- Can be stored in the adapter, isolated from line voltage.
- Brooks Patented.

CAUTION: Only 2 fuses can be used in this adapter at any one time.
