

Shore Power Generator–Shore Power Relay SN, SM & 54

PEARL: It is important to note that there was no breaker protection at the point of entry on all SMs. These shore power wires are getting old and many are beyond life expectancy. When replacing the shore power wire on a SM, the owner might consider leaving the old wire in place from the generator/shore power relay control box that we are discussing to a point inside the port side of the Lazarette. At that point install a double pole 20 amp breaker on a newly installed box. From this newly installed box and breaker install a new shore power wire and plug.

Generator-Shore Power Relay - Pre-Millennium (Pre-SM 2000)

The Generator-Shore Power Relay is located on a bulkhead inside the cockpit lazarette and behind the white plywood cover. The Dessalator Controls and the Cooking Gas Valve is on the same bulkhead.
