

**WITT Energy and a new solution in harvesting the motion that is all around us, turning it into useable power which can be stored and called upon when needed.**

**What is the WITT?** The WITT is a unique patented transmission that can take motional energy and turn it into electricity. The WITT can be built from a few inches or many metres.

**What is unique about the WITT transmission system, and what products are we working on?**

The WITT is unique in that it can take all Natural Occurring Motional Energy (NOME) that is all around us, in Water, (sea, river or tidal), in Wind, (our small portable dragonflies) in Human, fitted in a backpack to harvest walking, jogging etc to harvest power, and Animals providing power solutions in developing countries for topping up mobile phones and the IoT's. Other energy devices are out there taking 1 degree of motion, maybe 2, we are unique in that we take all available motion that is available and turn it into electrical power which can be stored and called upon when needed. The products we are building will be the portable power solution that can be fitted inside a rucksack harvest chaotic motion for the defence and leisure market. The same 5-watt unit could also be utilised to collect animal motion, a great benefit in developing countries to provide LED power and charging appliances. The second unit we have built will be for the marine sector, a sealed completely green solution to harvest all water motion providing power even in the most remote locations with no need for sunlight, a real bonus in the Northern hemisphere where there is limited daylight.

**Who invented the WITT and is there patent protection?** The WITT was invented by Martin Wickett, a civil engineer who worked on building roads and bridges, the first WITT was built in our workshop in France after we finished rebuilding a 17<sup>th</sup> century farmhouse. Martin loves resolving complex engineering problems, after building the first unit and testing it, the next stage was to check if it was patentable. It took several years to get a granted patent, as the business progress we ensured we filed follow on patents. We have a granted patent in USA, China, UK, and core countries across the globe.

**Does WITT have a strong team in place?** WITT has a great team in place, our chairman is Admiral Sir James Burnell-Nugent, our CEO Ron Cowley has 35 years of bringing engineering products to the market, Martin Wickett the inventor, is our CTO, we have Tushar Kulkarni as Head of Engineering and Ash Harkara as Head of Electrical. As Martin 's wife I have worked from day one to raise awareness, network and present.

**What next for WITT?** WITT are ready to engage with manufacturers organisations, of course we have a range of options, bringing in a major investor, licensing, collaborations, or joint ventures. WITT has raised global awareness winning many awards in the UK and overseas, we have won Ocean Exchange, Leap to Zero, we won HRH, Prince Andrew, pitch at the palace, and last week we won a place to present at the WORLD FUTURE ENERGY SUMMIT in Abu Dhabi, UAE a very prestigious event seeking new clean green energy solutions. WITT team are passionate about providing an energy solution **WITT believe we can, together we will.**
