

2018 Press Release

Noritake Co., Inc.

Noritake Co, Inc proudly introduces two new enhancements to our touch TFT products that will greatly improve reliability and input consistency. Noritake has recently developed a high signal to noise ratio projective capacitance touch technology FLEATS® that allows continuous repeatability, even when water drops are on its surface.

Another advantage with our new touch technology is the ability to work through a protective clear overlay - up to 10 mm thick. A very desirable feature for capacitive touch displays when exposed to mechanical destruction or chemical contaminants.

Stop at Noritake booth # V37 and see our new touch TFT products running these demos first hand.

We are at the Printed Electronics Show Santa Clara Convention Center Nov 14th and Nov 15th.
