+ more

- ✓ View and alter configurations
- ✓ Monitor, track, and manage changes
- ✓ Maintain and align multiple environments
- ✓ Conduct wide-ranging impact analysis
- ✓ Pinpoint exact changes that caused bugs, and revert
- ✓ Keep teams coordinated
- ✓ Enforce compliance controls and documentation

SaaS has gotten out of hand, hasn't it?

Software ate the world and left behind a mess.
There's now more 'work about work' than ever.
Departments operate independently and back office applications look like a forest of silos.

The funny thing is, business system management shares a lot in common with software development, but lags far behind in process and tooling.

Most business applications teams still can't:

- ✗ Predict the impact of changes
- ✗ Stage, test, or roll back changes
- ✗ Track and document changes
- ✗ Understand cross-system dependencies
- ✗ Search configurations
- ✗ Easily onboard new team members

Salto gives you that missing visibility and structure

Salto sits on top of your business applications.
It's one interface to:

- Extract and translate configurations
- Explore and search them in one interface
- Inspect elements and understand their dependencies
- Understand the context and impact of changes
- Compare configurations across environments
- Move configuration changes between environments
- Conduct bulk "search and replace" operations
- Get alerted about important changes
- Confidently deploy changes
- (With Git) Test and roll back changes
- Document everything

But how does it work?

salto

Salto makes your business systems explainable

Salto makes well-developed concepts and methodologies that already exist in software development available to business applications teams. It translates all those configurations into a structured, consistent language.

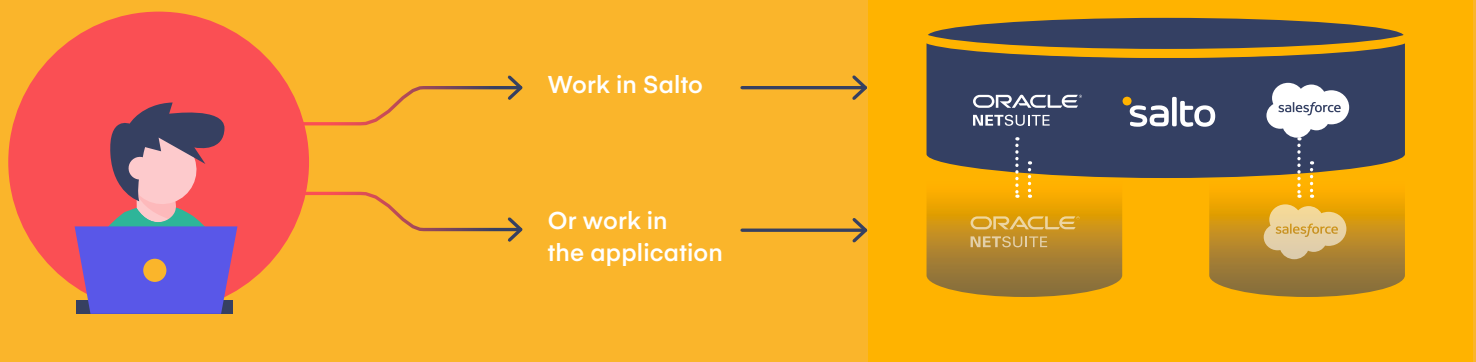

How it works:

- Launch Salto
- Connect your applications
- Extract and display their configurations
- Search, test, and deploy changes in Salto's declarative language (NaCl), or in the system's interface
- Copy flows across environments
- Use it across applications

Salto + Git provide:

- ✓ One language for all systems (NaCl)
- ✓ Version control
- ✓ Branching and commits
- ✓ Rollbacks
- ✓ Automation
- ✓ Impact analysis
- ✓ Documentation
- ✓ Search
- ✓ Bulk search and replace
- ✓ Compare across environments

Salto gives you visibility and control over things the native interface doesn't

WalkMe now spends 77% less time managing Salesforce — 

With Salto, you're in control

Plan with confidence — Search configurations, record in-line documentation, save structured references, and give real-time feedback. You'll have full context of past changes, and can test proposed changes.

Build smart and pay down debt — Compare settings across environments to assess, align, and deploy. Use standard features like "find and replace" and "copy-paste" across your business applications.

Deliver bug-free applications — Once you're ready, click a single button to deploy a change across environments and applications. The built-in Git client lets you version, debug, and revert if needed.

Audit on the fly — Salto allows you to maintain an always up-to-date, easy to read, context-filled trail of all the changes made across applications and workspaces. Specifically, using Git, you can connect documented changes with their respective ticketing system request. You can also set up alerts so you're notified of important changes.

Lots of smart companies rely on Salto

Salto clears up our time to focus on helping leading enterprises worldwide meet their tech ROI expectations, while focusing on Digital Adoption.

— Tal Carmi, Global VP Information Systems, WalkMe

Automating otherwise manual processes, Salto fundamentally improved the way we track, audit and make changes on NetSuite.
