What is "capacitive touchscreen"?

In the cell [phone industry](#), there are two major categories of touchscreen displays: capacitive touchscreens and resistive touchscreens. Capacitive touchscreen displays rely on the electrical properties of the human body to detect when and where on a display the user touches. Because of this, capacitive displays can be controlled with very light touches of a finger and generally cannot be used with a mechanical stylus or a gloved hand. Examples of devices with capacitive touchscreens are the Apple iPhone and the T-Mobile G1. However, some modern displays like the [Nokia Lumia 1520](#) are designed to support ultra sensitivity that can detect touches while gloves are worn.
