1 2 3 4 5 6 7 8 9	A Yes, I have. Q How many times? A Probably around a dozen times. Q So I'm sure because you've been deposed before, you're familiar with the rules and procedures of how today is going to work. But we'll just review them quickly to remind you of a couple of things. First, obviously, this is a question and answer process. So I'll ask you the	1 2 3 4 5 6 7 8 9	Page 9 So from time to time, I may ask you a question that Mr. Lang may object to. Unless he instructs you not to answer, you can go ahead and answer. Do you understand? A Yes. Q Dr. Banerjee, you're not on any medication today, are you? A No. Q There's nothing that would prevent you
1 2 3 4 5 6 7 8 9 10 11	A Yes, I have. Q How many times? A Probably around a dozen times. Q So I'm sure because you've been deposed before, you're familiar with the rules and procedures of how today is going to work. But we'll just review them quickly to remind you of a couple of things. First, obviously, this is a question and answer process. So I'll ask you the questions and in your answer, please not only	1 2 3 4 5 6 7 8 9 10 11	Page 9 So from time to time, I may ask you a question that Mr. Lang may object to. Unless he instructs you not to answer, you can go ahead and answer. Do you understand? A Yes. Q Dr. Banerjee, you're not on any medication today, are you? A No. Q There's nothing that would prevent you from testifying truthfully and accurately today:
1 2 3 4 5 6 7 8 9 10 11 12	A Yes, I have. Q How many times? A Probably around a dozen times. Q So I'm sure because you've been deposed before, you're familiar with the rules and procedures of how today is going to work. But we'll just review them quickly to remind you of a couple of things. First, obviously, this is a question and answer process. So I'll ask you the questions and in your answer, please not only give your attorney, Mr. Lang, time to object,	1 2 3 4 5 6 7 8 9 10 11 12	Page 9 So from time to time, I may ask you a question that Mr. Lang may object to. Unless he instructs you not to answer, you can go ahead and answer. Do you understand? A Yes. Q Dr. Banerjee, you're not on any medication today, are you? A No. Q There's nothing that would prevent you from testifying truthfully and accurately today; is that right?
1 2 3 4 5 6 7 8 9 10 11 12 13	A Yes, I have. Q How many times? A Probably around a dozen times. Q So I'm sure because you've been deposed before, you're familiar with the rules and procedures of how today is going to work. But we'll just review them quickly to remind you of a couple of things. First, obviously, this is a question and answer process. So I'll ask you the questions and in your answer, please not only give your attorney, Mr. Lang, time to object, but also try to speak slowly and clearly for our	1 2 3 4 5 6 7 8 9 10 11 12 13	Page 9 So from time to time, I may ask you a question that Mr. Lang may object to. Unless he instructs you not to answer, you can go ahead and answer. Do you understand? A Yes. Q Dr. Banerjee, you're not on any medication today, are you? A No. Q There's nothing that would prevent you from testifying truthfully and accurately today; is that right? A I take blood pressure medication, but
1 2 3 4 5 6 7 8 9 10 11 12 13 14	A Yes, I have. Q How many times? A Probably around a dozen times. Q So I'm sure because you've been deposed before, you're familiar with the rules and procedures of how today is going to work. But we'll just review them quickly to remind you of a couple of things. First, obviously, this is a question and answer process. So I'll ask you the questions and in your answer, please not only give your attorney, Mr. Lang, time to object, but also try to speak slowly and clearly for our court reporter who's going to do a great job.	1 2 3 4 5 6 7 8 9 10 11 12 13 14	 Page 9 So from time to time, I may ask you a question that Mr. Lang may object to. Unless he instructs you not to answer, you can go ahead and answer. Do you understand? A Yes. Q Dr. Banerjee, you're not on any medication today, are you? A No. Q There's nothing that would prevent you from testifying truthfully and accurately today; is that right? A I take blood pressure medication, but it does not
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	A Yes, I have. Q How many times? A Probably around a dozen times. Q So I'm sure because you've been deposed before, you're familiar with the rules and procedures of how today is going to work. But we'll just review them quickly to remind you of a couple of things. First, obviously, this is a question and answer process. So I'll ask you the questions and in your answer, please not only give your attorney, Mr. Lang, time to object, but also try to speak slowly and clearly for our court reporter who's going to do a great job. And please give verbal answers because nodding	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	 Page 9 So from time to time, I may ask you a question that Mr. Lang may object to. Unless he instructs you not to answer, you can go ahead and answer. Do you understand? A Yes. Q Dr. Banerjee, you're not on any medication today, are you? A No. Q There's nothing that would prevent you from testifying truthfully and accurately today; is that right? A I take blood pressure medication, but it does not Q Does not affect you?
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	A Yes, I have. Q How many times? A Probably around a dozen times. Q So I'm sure because you've been deposed before, you're familiar with the rules and procedures of how today is going to work. But we'll just review them quickly to remind you of a couple of things. First, obviously, this is a question and answer process. So I'll ask you the questions and in your answer, please not only give your attorney, Mr. Lang, time to object, but also try to speak slowly and clearly for our court reporter who's going to do a great job. And please give verbal answers because nodding your head is not going to show up on the	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	 Page 9 So from time to time, I may ask you a question that Mr. Lang may object to. Unless he instructs you not to answer, you can go ahead and answer. Do you understand? A Yes. Q Dr. Banerjee, you're not on any medication today, are you? A No. Q There's nothing that would prevent you from testifying truthfully and accurately today; is that right? A I take blood pressure medication, but it does not Q Does not affect you? A No.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	A Yes, I have. Q How many times? A Probably around a dozen times. Q So I'm sure because you've been deposed before, you're familiar with the rules and procedures of how today is going to work. But we'll just review them quickly to remind you of a couple of things. First, obviously, this is a question and answer process. So I'll ask you the questions and in your answer, please not only give your attorney, Mr. Lang, time to object, but also try to speak slowly and clearly for our court reporter who's going to do a great job. And please give verbal answers because nodding your head is not going to show up on the transcript.	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	 Page 9 So from time to time, I may ask you a question that Mr. Lang may object to. Unless he instructs you not to answer, you can go ahead and answer. Do you understand? A Yes. Q Dr. Banerjee, you're not on any medication today, are you? A No. Q There's nothing that would prevent you from testifying truthfully and accurately today; is that right? A I take blood pressure medication, but it does not Q Does not affect you? A No. Q Great. Sir, what is your current job
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	A Yes, I have. Q How many times? A Probably around a dozen times. Q So I'm sure because you've been deposed before, you're familiar with the rules and procedures of how today is going to work. But we'll just review them quickly to remind you of a couple of things. First, obviously, this is a question and answer process. So I'll ask you the questions and in your answer, please not only give your attorney, Mr. Lang, time to object, but also try to speak slowly and clearly for our court reporter who's going to do a great job. And please give verbal answers because nodding your head is not going to show up on the transcript. Also, it's important that we try to	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	Page 9 So from time to time, I may ask you a question that Mr. Lang may object to. Unless he instructs you not to answer, you can go ahead and answer. Do you understand? A Yes. Q Dr. Banerjee, you're not on any medication today, are you? A No. Q There's nothing that would prevent you from testifying truthfully and accurately today; is that right? A I take blood pressure medication, but it does not Q Does not affect you? A No. Q Great. Sir, what is your current job title?
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	A Yes, I have. Q How many times? A Probably around a dozen times. Q So I'm sure because you've been deposed before, you're familiar with the rules and procedures of how today is going to work. But we'll just review them quickly to remind you of a couple of things. First, obviously, this is a question and answer process. So I'll ask you the questions and in your answer, please not only give your attorney, Mr. Lang, time to object, but also try to speak slowly and clearly for our court reporter who's going to do a great job. And please give verbal answers because nodding your head is not going to show up on the transcript. Also, it's important that we try to speak clearly so we don't talk over each other so it's again again for the court reporter	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	 Page 9 So from time to time, I may ask you a question that Mr. Lang may object to. Unless he instructs you not to answer, you can go ahead and answer. Do you understand? A Yes. Q Dr. Banerjee, you're not on any medication today, are you? A No. Q There's nothing that would prevent you from testifying truthfully and accurately today; is that right? A I take blood pressure medication, but it does not Q Does not affect you? A No. Q Great. Sir, what is your current job title? A The Cockrell chair professor of abetrical answer government.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	A Yes, I have. Q How many times? A Probably around a dozen times. Q So I'm sure because you've been deposed before, you're familiar with the rules and procedures of how today is going to work. But we'll just review them quickly to remind you of a couple of things. First, obviously, this is a question and answer process. So I'll ask you the questions and in your answer, please not only give your attorney, Mr. Lang, time to object, but also try to speak slowly and clearly for our court reporter who's going to do a great job. And please give verbal answers because nodding your head is not going to show up on the transcript. Also, it's important that we try to speak clearly so we don't talk over each other so it's, again, easier for the court reporter today	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	 Page 9 So from time to time, I may ask you a question that Mr. Lang may object to. Unless he instructs you not to answer, you can go ahead and answer. Do you understand? A Yes. Q Dr. Banerjee, you're not on any medication today, are you? A No. Q There's nothing that would prevent you from testifying truthfully and accurately today; is that right? A I take blood pressure medication, but it does not Q Does not affect you? A No. Q Great. Sir, what is your current job title? A The Cockrell chair professor of electrical answer computer of engineering at the University of Texas. Lalso am the director of
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	A Yes, I have. Q How many times? A Probably around a dozen times. Q So I'm sure because you've been deposed before, you're familiar with the rules and procedures of how today is going to work. But we'll just review them quickly to remind you of a couple of things. First, obviously, this is a question and answer process. So I'll ask you the questions and in your answer, please not only give your attorney, Mr. Lang, time to object, but also try to speak slowly and clearly for our court reporter who's going to do a great job. And please give verbal answers because nodding your head is not going to show up on the transcript. Also, it's important that we try to speak clearly so we don't talk over each other so it's, again, easier for the court reporter today. Obviously, it may be a long day, but	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	 Page 9 So from time to time, I may ask you a question that Mr. Lang may object to. Unless he instructs you not to answer, you can go ahead and answer. Do you understand? A Yes. Q Dr. Banerjee, you're not on any medication today, are you? A No. Q There's nothing that would prevent you from testifying truthfully and accurately today; is that right? A I take blood pressure medication, but it does not Q Does not affect you? A No. Q Great. Sir, what is your current job title? A The Cockrell chair professor of electrical answer computer of engineering at the University of Texas. I also am the director of the Microelectronics Research Center there
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	A Yes, I have. Q How many times? A Probably around a dozen times. Q So I'm sure because you've been deposed before, you're familiar with the rules and procedures of how today is going to work. But we'll just review them quickly to remind you of a couple of things. First, obviously, this is a question and answer process. So I'll ask you the questions and in your answer, please not only give your attorney, Mr. Lang, time to object, but also try to speak slowly and clearly for our court reporter who's going to do a great job. And please give verbal answers because nodding your head is not going to show up on the transcript. Also, it's important that we try to speak clearly so we don't talk over each other so it's, again, easier for the court reporter today. Obviously, it may be a long day, but it's not a marathon. We want to be sure if you	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	 Page 9 So from time to time, I may ask you a question that Mr. Lang may object to. Unless he instructs you not to answer, you can go ahead and answer. Do you understand? A Yes. Q Dr. Banerjee, you're not on any medication today, are you? A No. Q There's nothing that would prevent you from testifying truthfully and accurately today; is that right? A I take blood pressure medication, but it does not Q Does not affect you? A No. Q Great. Sir, what is your current job title? A The Cockrell chair professor of electrical answer computer of engineering at the University of Texas. I also am the director of the Microelectronics Research Center there. O And how long have you had that
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24	A Yes, I have. Q How many times? A Probably around a dozen times. Q So I'm sure because you've been deposed before, you're familiar with the rules and procedures of how today is going to work. But we'll just review them quickly to remind you of a couple of things. First, obviously, this is a question and answer process. 1	since 1987 when Lioined as an assistant	1	an assistant professor in 1987 at University of
2	professor. Then I became the director I believe	2	Texas?
3	in 1999 and then I also became the Cockrell	3	A Yes
4	chair around that time	4	O What was that?
5	0 What are your responsibilities job	5	A I got my Ph D from the University of
6	responsibilities in your current position only?	6	Illinois in 1983 I started working at Texas
7	A Well as a professor I director	7	Instruments in Dallas in their corporate
8	research done by my graduate students and it's a	8	research labs
9	multifaceted job involving writing research	9	O And what was your responsibility while
10	grants, get funding, and then directing the	10	vou were working for Texas Instruments at
11	research of my graduate students, help write and	11	Dallas?
12	edit the research papers and things like that.	12	A As part of the team that worked on
13	In addition, as director of the	13	dynamic random access memories, DRAMs, where we
14	microelectronics center, we have a clean room	14	worked on trench capacitor sales for DRAMs.
15	where my colleagues and I fabricate	15	We actually made the world's first
16	microelectronic devices things like transistors,	16	4 megabit DRAM at that time.
17	capacitors. So in that role, I manage the clean	17	Q You mentioned trench capacitor. Are
18	room, the equipment, I manage the engineers who	18	you familiar with the term "stacked capacitor"?
19	run the equipment and maintain the equipment and	19	A Yes.
20	things like that.	20	Q What is the difference between a
21	So I wear two hats.	21	trench capacitor and a stack capacitor?
22	Q And you also teach students, I would	22	A So in a DRAM, you store charge in a
23	assume?	23	capacitor, through what is called an access
24	A Yes.	24	transistor. And unfortunately, the charge tends
25	Q Did you have any jobs prior to being	25	to leak away from the capacitor. That's why a
	Page 12		Page 13
1	DRAM is dynamic in the sense that you have to	1	MR. LEN: Absolutely. I appreciate
2	periodically refresh the information in the	2	that. If you don't mind, I'm just going to
3	cell.	3	finish with
4	To make sure that the information does	4	MR. LANG: Sure.
5	not get destroyed, you need a certain minute	5	MR. LEN: with Dr. Banerjee's
6	amount of storage capacitance and therefore,	6	right after this, I'll let you finish the
7	storage charge. And the problem has been as	7	train of thought on Dr. Banerjee's
8	chips have been scaled according to Moore's law,	8	employment and educational occasional
9	the area that it can devote to a memory cell has	9	history.
10	shrunk and therefore, people want to maintain	10	BY MR. LEN:
11	enough cell capacitance.		Q So, Dr. Banerjee, you mentioned that
12	And the two ways people have done that	12	prior to starting at University of Texas, you
13	is to basically use the a third dimension on the	13	worked at Texas Instruments. Did you have any
14	chip. You either go down and dig a hole or		positions prior to Texas Instruments?
15	trench so that you have a larger surface area on	1 15	A When I was doing my Ph.D, I was
16		10	
17	the trench walls to do work for the capacitor or	16	appointed as a graduate research assistant. And
10 17	the trench walls to do work for the capacitor or you can stack up multiple electrodes, so you go	16 17	appointed as a graduate research assistant. And then after I got my Ph.D. for a couple of months, before Lipingd TL Lynglad as
17 18	the trench walls to do work for the capacitor or you can stack up multiple electrodes, so you go up the vertical dimension.	16 17 18	appointed as a graduate research assistant. And then after I got my Ph.D. for a couple of months, before I joined TI, I worked as a visiting assistant professor at the University
17 18 19	the trench walls to do work for the capacitor or you can stack up multiple electrodes, so you go up the vertical dimension. MR. LANG: Greg, I think we should read the IPP proceedings on the record that	16 17 18 19	appointed as a graduate research assistant. And then after I got my Ph.D. for a couple of months, before I joined TI, I worked as a visiting assistant professor at the University of Illinois

1	'539 patent this morning.	1	If any documents refreshed your
2	Q And did you do anything to prepare	2	recollection, you can identify those.
3	before today?	3	Otherwise, it's privileged and on that
4	A Yes.	4	basis, I instruct you not to answer.
5	Q What did you do?	5	BY MR. LEN:
6	A I met with counsel two days.	6	Q I don't want to know what you talked
7	Q Did you meet with anyone else besides	7	about with your attorneys, just if you can
8	your attorneys?	8	remember if any documents that you reviewed that
9	A No.	9	refreshed your recollection prior to today.
10	Q Did you have any discussions with	10	A I'm not sure what you mean by
11	anyone at Micron in preparation for today?	11	refreshed my recollection. In what sense? I am
12	A No.	12	a little bit confused.
13	Q Did you have any discussions with	13	Q Anything that helped your memory as to
14	anyone besides your attorneys in preparation for	14	your testimony of what's in your declarations
15	today?	15	that we're here to speak about today.
16	A No.	16	A Okay. So once again, I looked at the
17	Q In your preparations prior to today,	17	IPRs themselves, I looked at my declarations, I
18	prior to this morning, did you review any	18	looked at the Patents '016, '539. I looked at
19	documents?	19	the Buchanan patent, the Senzaki patent, the Min
20	A Yes.	20	document, the Shin document. And then those are
21	Q What documents did you review prior to	21	the main ones.
22	today?	22	Q So, Doctor, if I can direct your
23	MR. LANG: I'll instruct the witness	23	attention to what should be marked as Exhibit
24	to only disclose that if the for	24	Number 2, which is your 662 '539 patent
25	documents that refreshed your recollection.	25	declaration.
	Page 20		Page 21
1	A Okay.	1	A Yes.
2	Q More specifically, if I can direct	2	Q Okay. If I can now turn your
3	your attention to let's see here. Direct	3	attention to Exhibit Number 4 for the '016
4	your attention to Paragraph 79 on Page 38. Once	4	patent. If I can direct your attention to

5	your attention to let's see here. Direct	1 2	attention to Exhibit Number 4 for the 010
4	your attention to Paragraph 79 on Page 38. Once	4	patent. If I can direct your attention to
5	you're ready, Doctor.	5	Paragraph 79 in that declaration as well.
6	A Yes.	6	A Yes, I see that.
7	Q You agree with me that the claims of	7	Q You would agree with me that the
8	the strike that.	8	process recited in Claims 1 through 3 and 5
9	You agree with me that Claims 24, 26	9	through 10 of the '016 patent is clearly
10	and 29 of the '539 patent are clearly reciting	10	reciting ALD; correct?
11	ALD process; is that correct?	11	A May I have a copy of the '016 patent,
12	MR. LANG: Objection, form.	12	please.
13	THE WITNESS: May I have a copy of the	13	MR. LEN: Doctor, I'm going to hand to
14	'539 patent, please?	14	the court reporter to be marked as Banerjee
15	MR. LEN: Doctor, I'm handing the	15	Exhibit Number 8 is a copy of U.S. Patent
16	court reporter what will be marked as	16	8,334,016. In the lower right-hand corner
17	Banerjee Exhibit Number 7, a copy of	17	it's also marked as Micron Exhibit 1001.
18	U.S. Patent 6,969,539. The lower right-hand	18	(Exhibit 8 was marked.)
19	corner it's marked as Micron Exhibit 1001.	19	BY MR. LEN:
20	(Exhibit 7 was marked.)	20	Q After reviewing the '016 patent,
21	BY MR. LEN:	21	Doctor, do you agree with me that the Claims 1
22	Q So just to circle back, your statement	22	through 3 the process recited in Claims 1
23	in your declaration that these claims, Claim 24,	23	through 3 and 5 through 10 of the '016 patent
24	26 and 29 of the '539 patent, are clearly	24	are clearly reciting ALD?
25	reciting ALD. You agree with that; correct?	25	A Yes.

6 (Pages 18 to 21)

	Page 22		Page 23
1	O Doctor Are you familiar with chemical	1	A So typically these precursors or
2	vapor deposition?	2	reactants are flowed into the chamber and it's
3	A Yes.	3	easy to transport those reactants if they are in
4	O Are you comfortable with the	4	a gas or vapor phase.
5	abbreviation CVD?	5	Now, typically you provide some sort
6	A Yes.	6	of energy to induce chemical reactions between
7	O What is your general description of	7	the molecules of the reactants that are
8	CVD?	8	introduced into the chamber. For the sake of
9	A I've been working on CVD for probably	9	simplicity, let's assume there's just two
10	over 30 years as part of my research. You	10	reactants that are reacting.
11	introduce multiple reactants into a reaction	11	So you introduce them into the CVD
12	chamber in which you place a substrate on which	12	chamber and by providing thermal energy or in
13	you're trying to grow a film.	13	some cases plasma excitation if you're doing
14	And as the term CVD implies, these	14	plasma CVD, you induce some reactions between
15	reactants or precursors that are introduced into	15	the molecules of the two reactants in the gas
16	the reaction chamber undergo some sort of a	16	phase. That, by the way, is known as
17	chemical reaction, perhaps partly in the gas	17	homogeneous reaction.
18	phase but also on the surface of the substrate.	18	But generally speaking, you don't want
19	The specific details depend on what kind of CV	19	the reaction for a well designed CVD process,
20	reaction you're talking about.	20	you don't want the reaction to go all the way to
21	Q In your answer about CVD, you	21	completion in the gas phase. You want the
22	mentioned the chemical reaction that partly	22	surface of the substrate to play a role also,
23	could occur in the gas phase.	23	which then leads to the deposition of film on
24	What do you mean when you say gas	24	the surface of the substrate.
25	phase reactions?	25	Q Doctor, in your previous answer you
	Page 24		Page 25
1	Page 24 mentioned that when you're introducing the	1	Page 25 MR. LANG: Objection, form.
1 2	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal	1 2	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you
1 2 3	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy.	1 2 3	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you
1 2 3 4	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean	1 2 3 4	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period
1 2 3 4 5	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct?	1 2 3 4 5	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there
1 2 3 4 5 6	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes.	1 2 3 4 5 6	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth
1 2 3 4 5 6 7	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of	1 2 3 4 5 6 7	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts.
1 2 3 4 5 6 7 8	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time?	1 2 3 4 5 6 7 8	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the
1 2 3 4 5 6 7 8 9	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily.	1 2 3 4 5 6 7 8 9	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the
1 2 3 4 5 6 7 8 9 10	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in	1 2 3 4 5 6 7 8 9 10	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in
1 2 3 4 5 6 7 8 9 10 11	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in the CVD reaction?	1 2 3 4 5 6 7 8 9 10 11	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in that sense.
1 2 3 4 5 6 7 8 9 10 11 12	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in the CVD reaction? A In some cases, yes.	1 2 3 4 5 6 7 8 9 10 11 12	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in that sense. BY MR. LEN:
1 2 3 4 5 6 7 8 9 10 11 12 13	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in the CVD reaction? A In some cases, yes. Q Doctor, do you agree that the do	1 2 3 4 5 6 7 8 9 10 11 12 13	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in that sense. BY MR. LEN: Q So, Doctor, changing gears, are you
1 2 3 4 5 6 7 8 9 10 11 12 13 14	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in the CVD reaction? A In some cases, yes. Q Doctor, do you agree that the do you agree that the strike that.	1 2 3 4 5 6 7 8 9 10 11 12 13 14	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in that sense. BY MR. LEN: Q So, Doctor, changing gears, are you familiar with atomic layer deposition?
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in the CVD reaction? A In some cases, yes. Q Doctor, do you agree that the do you agree that the strike that. You mentioned deposition on a film of	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in that sense. BY MR. LEN: Q So, Doctor, changing gears, are you familiar with atomic layer deposition? A Yes.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in the CVD reaction? A In some cases, yes. Q Doctor, do you agree that the do you agree that the strike that. You mentioned deposition on a film of a surface as a result of a CVD reaction;	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in that sense. BY MR. LEN: Q So, Doctor, changing gears, are you familiar with atomic layer deposition? A Yes. Q And are you familiar with the
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in the CVD reaction? A In some cases, yes. Q Doctor, do you agree that the do you agree that the strike that. You mentioned deposition on a film of a surface as a result of a CVD reaction; correct?	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in that sense. BY MR. LEN: Q So, Doctor, changing gears, are you familiar with atomic layer deposition? A Yes. Q And are you familiar with the abbreviation ALD?
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in the CVD reaction? A In some cases, yes. Q Doctor, do you agree that the do you agree that the strike that. You mentioned deposition on a film of a surface as a result of a CVD reaction; correct? A Yes.	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in that sense. BY MR. LEN: Q So, Doctor, changing gears, are you familiar with atomic layer deposition? A Yes. Q And are you familiar with the abbreviation ALD? A Yes.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in the CVD reaction? A In some cases, yes. Q Doctor, do you agree that the do you agree that the strike that. You mentioned deposition on a film of a surface as a result of a CVD reaction; correct? A Yes. Q Are you comfortable characterizing	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 9 0	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in that sense. BY MR. LEN: Q So, Doctor, changing gears, are you familiar with atomic layer deposition? A Yes. Q And are you familiar with the abbreviation ALD? A Yes. Q Okay. So it's okay if we use that
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in the CVD reaction? A In some cases, yes. Q Doctor, do you agree that the do you agree that the strike that. You mentioned deposition on a film of a surface as a result of a CVD reaction; correct? A Yes. Q Are you comfortable characterizing that deposition of a film as growth of the film?	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in that sense. BY MR. LEN: Q So, Doctor, changing gears, are you familiar with atomic layer deposition? A Yes. Q And are you familiar with the abbreviation ALD? A Yes. Q Okay. So it's okay if we use that abbreviation today?
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in the CVD reaction? A In some cases, yes. Q Doctor, do you agree that the do you agree that the strike that. You mentioned deposition on a film of a surface as a result of a CVD reaction; correct? A Yes. Q Are you comfortable characterizing that deposition of a film as growth of the film? A People use that term sometimes	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in that sense. BY MR. LEN: Q So, Doctor, changing gears, are you familiar with atomic layer deposition? A Yes. Q And are you familiar with the abbreviation ALD? A Yes. Q Okay. So it's okay if we use that abbreviation today? A Sure.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in the CVD reaction? A In some cases, yes. Q Doctor, do you agree that the do you agree that the strike that. You mentioned deposition on a film of a surface as a result of a CVD reaction; correct? A Yes. Q Are you comfortable characterizing that deposition of a film as growth of the film? A People use that term sometimes interchangeably.	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in that sense. BY MR. LEN: Q So, Doctor, changing gears, are you familiar with atomic layer deposition? A Yes. Q And are you familiar with the abbreviation ALD? A Yes. Q Okay. So it's okay if we use that abbreviation today? A Sure. Q Okay. I guess to start, could you
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in the CVD reaction? A In some cases, yes. Q Doctor, do you agree that the do you agree that the strike that. You mentioned deposition on a film of a surface as a result of a CVD reaction; correct? A Yes. Q Are you comfortable characterizing that deposition of a film as growth of the film? A People use that term sometimes interchangeably. Q And do you agree that CVD growth of a	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	 Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in that sense. BY MR. LEN: Q So, Doctor, changing gears, are you familiar with atomic layer deposition? A Yes. Q And are you familiar with the abbreviation ALD? A Yes. Q Okay. So it's okay if we use that abbreviation today? A Sure. Q Okay. I guess to start, could you give me your explanation of what ALD is?
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in the CVD reaction? A In some cases, yes. Q Doctor, do you agree that the do you agree that the strike that. You mentioned deposition on a film of a surface as a result of a CVD reaction; correct? A Yes. Q Are you comfortable characterizing that deposition of a film as growth of the film? A People use that term sometimes interchangeably. Q And do you agree that CVD growth of a film is continuous as long as there is an	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25	 Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in that sense. BY MR. LEN: Q So, Doctor, changing gears, are you familiar with atomic layer deposition? A Yes. Q And are you familiar with the abbreviation ALD? A Yes. Q Okay. So it's okay if we use that abbreviation today? A Sure. Q Okay. I guess to start, could you give me your explanation of what ALD is? A So an ALD, typically you have to have time a bare start.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25	Page 24 mentioned that when you're introducing the components into the chamber, you provide thermal energy. By thermal energy it could mean heating the chamber; is that correct? A Typically, yes. Q And does CVD require introduction of multiple components at the same time? A Not necessarily. Q So a single component could result in the CVD reaction? A In some cases, yes. Q Doctor, do you agree that the do you agree that the strike that. You mentioned deposition on a film of a surface as a result of a CVD reaction; correct? A Yes. Q Are you comfortable characterizing that deposition of a film as growth of the film? A People use that term sometimes interchangeably. Q And do you agree that CVD growth of a film is continuous as long as there is an available supply of reactants into the chamber?	$ \begin{array}{c} 1\\2\\3\\4\\5\\6\\7\\8\\9\\10\\11\\12\\13\\14\\15\\16\\17\\18\\19\\20\\21\\22\\23\\24\\25\end{array} $	 Page 25 MR. LANG: Objection, form. THE WITNESS: It depends on what you mean by "continuous." So in some cases, you can have what's called an incubation period or a nucleation period where initially there is negligible growth and then the growth starts. But typically, as long as the reactants are available in the chamber, the growth will continue. So it's continuous in that sense. BY MR. LEN: Q So, Doctor, changing gears, are you familiar with atomic layer deposition? A Yes. Q And are you familiar with the abbreviation ALD? A Yes. Q Okay. So it's okay if we use that abbreviation today? A Sure. Q Okay. I guess to start, could you give me your explanation of what ALD is? A So an ALD, typically you have to have two reactants which are introduced alternatively

7 (Pages 22 to 25)

		-	
	Page 26		Page 27
1	into the reaction chamber. You flow in reactant	1	A Yes, I see that.
2	Number 1 and induce some sort of a chemical	2	Q I think it's the third sentence down
3	reaction on the surface of the substrate.	3	in the middle of the paragraph, middle of the
4	And then you purge the reaction	4	page, starts with the sentence starts with:
5	chamber to remove the excess reactants and then	5	By adjusting the deposition conditions.
б	you flow reactant Number 2, have some suitable	6	Do you see that?
7	reaction on the surface of the substrate. Then	7	A Yes.
8	you purge excess reactant two and you repeat the	8	Q And it continues: Which is a routine
9	cycle till you have the proper thickness of the	9	optimization process done in ALD. The
10	film deposited.	10	sequential surface reaction I apologize.
11	Q Isn't it true that ALD requires the	11	The sequential surface processes can
12	ability to adjust the deposition condition such	12	be made to be, quote, self controlling, end
13	that the process can be made to be self	13	quote, or, quote, self limiting, end quote,
14	limiting?	14	meaning that the film growth does not continue
15	MR. LANG: Objection to form and	15	as a function of time or the availability of
16	relevance.	16	precursor gas.
17	THE WITNESS: It depends on what you	17	Do you see that?
18	mean by self limiting.	18	A Yes.
19	BY MR. LEN:	19	Q So do you agree with the statement
20	Q Well, let's turn to your declaration	20	that ALD requires the ability to adjust the
21	for the 662 IPR, which is the '539 or Exhibit 1.	21	deposition conditions such that the process can
22	I'm sorry, Exhibit 2, I apologize. Exhibit 1 is	22	be made to be self limiting?
23	the IPR petition.	23	MR. LANG: Objection to form and
24	If I can direct your attention to	24	relevance.
25	Paragraph 44 on Page 19 of your declaration.	25	THE WITNESS: ALD can be made self
	Page 28		Page 29
1	Page 28 limiting, but it does not necessarily have	1	Page 29 molecules impinging on the surface per unit
1 2	Page 28 limiting, but it does not necessarily have to be.	1 2	Page 29 molecules impinging on the surface per unit area.
1 2 3	Page 28 limiting, but it does not necessarily have to be. BY MR. LEN:	1 2 3	Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're
1 2 3 4	Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence	1 2 3 4	Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures
1 2 3 4 5	Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that	1 2 3 4 5	Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self
1 2 3 4 5 6	 Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in 	1 2 3 4 5 6	Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting.
1 2 3 4 5 6 7	 Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. 	1 2 3 4 5 6 7	Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN:
1 2 4 5 6 7 8	 Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? 	1 2 3 4 5 6 7 8	Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct?
1 2 3 4 5 6 7 8 9	Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes.	1 2 3 4 5 6 7 8 9	Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window.
1 2 4 5 6 7 8 9 10	Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes. Q Sorry. First, in your understanding,	1 2 3 4 5 6 7 8 9 10	 Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window. Q And within that window, the rate of
1 2 3 4 5 6 7 8 9 10 11	 Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes. Q Sorry. First, in your understanding, is ALE and ALD used interchangeably? 	1 2 3 4 5 6 7 8 9 10 11	 Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window. Q And within that window, the rate of growth won't be dependent on the temperature; is
1 2 3 4 5 6 7 8 9 10 11 12	 Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes. Q Sorry. First, in your understanding, is ALE and ALD used interchangeably? A Yes. 	1 2 3 4 5 6 7 8 9 10 11 12	 Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window. Q And within that window, the rate of growth won't be dependent on the temperature; is that correct?
1 2 3 4 5 6 7 8 9 10 11 12 13	 Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes. Q Sorry. First, in your understanding, is ALE and ALD used interchangeably? A Yes. Q Okay. So if I'm referring to an ALD 	1 2 3 4 5 6 7 8 9 10 11 12 13	Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window. Q And within that window, the rate of growth won't be dependent on the temperature; is that correct? MR. LANG: Objection to form.
1 2 3 4 5 6 7 8 9 10 11 12 13 14	 Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes. Q Sorry. First, in your understanding, is ALE and ALD used interchangeably? A Yes. Q Okay. So if I'm referring to an ALD window, even though it says ALE window, you 	1 2 3 4 5 6 7 8 9 10 11 12 13 14	 Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window. Q And within that window, the rate of growth won't be dependent on the temperature; is that correct? MR. LANG: Objection to form. THE WITNESS: The increase of the second second
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	 Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes. Q Sorry. First, in your understanding, is ALE and ALD used interchangeably? A Yes. Q Okay. So if I'm referring to an ALD window, even though it says ALE window, you understand they are the same? 	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	 Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window. Q And within that window, the rate of growth won't be dependent on the temperature; is that correct? MR. LANG: Objection to form. THE WITNESS: The increase of the thickness there would be no change of the
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes. Q Sorry. First, in your understanding, is ALE and ALD used interchangeably? A Yes. Q Okay. So if I'm referring to an ALD window, even though it says ALE window, you understand they are the same? A Yes.	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	 Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window. Q And within that window, the rate of growth won't be dependent on the temperature; is that correct? MR. LANG: Objection to form. THE WITNESS: The increase of the thickness there would be no change of the thickness in that growth cycle
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	 Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes. Q Sorry. First, in your understanding, is ALE and ALD used interchangeably? A Yes. Q Okay. So if I'm referring to an ALD window, even though it says ALE window, you understand they are the same? A Yes. Q So are you familiar with a concept of ALE of the same of the same	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window. Q And within that window, the rate of growth won't be dependent on the temperature; is that correct? MR. LANG: Objection to form. THE WITNESS: The increase of the thickness there would be no change of the thickness because of in that growth cycle as a function of temperature.
$ \begin{array}{c} 1\\2\\3\\4\\5\\6\\7\\8\\9\\10\\11\\12\\13\\14\\15\\16\\17\\18\\2\end{array} $	Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes. Q Sorry. First, in your understanding, is ALE and ALD used interchangeably? A Yes. Q Okay. So if I'm referring to an ALD window, even though it says ALE window, you understand they are the same? A Yes. Q So are you familiar with a concept of an ALD window?	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	 Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window. Q And within that window, the rate of growth won't be dependent on the temperature; is that correct? MR. LANG: Objection to form. THE WITNESS: The increase of the thickness there would be no change of the thickness because of in that growth cycle as a function of temperature.
$ \begin{array}{c} 1\\2\\3\\4\\5\\6\\7\\8\\9\\10\\11\\2\\13\\14\\15\\16\\17\\18\\9\\22\end{array} $	 Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes. Q Sorry. First, in your understanding, is ALE and ALD used interchangeably? A Yes. Q Okay. So if I'm referring to an ALD window, even though it says ALE window, you understand they are the same? A Yes. Q So are you familiar with a concept of an ALD window? A Yes. 	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	 Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window. Q And within that window, the rate of growth won't be dependent on the temperature; is that correct? MR. LANG: Objection to form. THE WITNESS: The increase of the thickness there would be no change of the thickness because of in that growth cycle as a function of temperature. BY MR. LEN: Q Within the window?
$ \begin{array}{c} 1\\2\\3\\4\\5\\6\\7\\8\\9\\10\\11\\12\\13\\14\\15\\16\\17\\18\\9\\20\\\end{array} $	Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes. Q Sorry. First, in your understanding, is ALE and ALD used interchangeably? A Yes. Q Okay. So if I'm referring to an ALD window, even though it says ALE window, you understand they are the same? A Yes. Q So are you familiar with a concept of an ALD window? A Yes. Q What is an ALD window?	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	 Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window. Q And within that window, the rate of growth won't be dependent on the temperature; is that correct? MR. LANG: Objection to form. THE WITNESS: The increase of the thickness there would be no change of the thickness because of in that growth cycle as a function of temperature. BY MR. LEN: Q Within the window? A Within the temperature window, yes.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 5 16 17 18 9 20 21	Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes. Q Sorry. First, in your understanding, is ALE and ALD used interchangeably? A Yes. Q Okay. So if I'm referring to an ALD window, even though it says ALE window, you understand they are the same? A Yes. Q So are you familiar with a concept of an ALD window? A Yes. Q What is an ALD window? A So when you optimize the ALD process,	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	 Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window, correct? A Within that window, the rate of growth won't be dependent on the temperature; is that correct? MR. LANG: Objection to form. THE WITNESS: The increase of the thickness there would be no change of the thickness because of in that growth cycle as a function of temperature. BY MR. LEN: Q Within the window? A Within the temperature window, yes. Q So I think following up on what we use fort dimensional parts of the parts of the second sec
1 2 3 4 5 6 7 8 9 10 11 12 13 14 5 6 7 8 9 10 11 12 13 14 5 6 7 8 9 10 11 22 23 20 21 22 22	Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes. Q Sorry. First, in your understanding, is ALE and ALD used interchangeably? A Yes. Q Okay. So if I'm referring to an ALD window, even though it says ALE window, you understand they are the same? A Yes. Q So are you familiar with a concept of an ALD window? A Yes. Q What is an ALD window? A So when you optimize the ALD process, one of the knobs you can adjust is the	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	 Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window, correct? A Within that window, the rate of growth won't be dependent on the temperature; is that correct? MR. LANG: Objection to form. THE WITNESS: The increase of the thickness because of in that growth cycle as a function of temperature. BY MR. LEN: Q Within the window? A Within the temperature window, yes. Q So I think following up on what we were just discussing, Doctor, if I can direct to the temperature window?
1 2 3 4 5 6 7 8 9 10 11 22 3 4 15 16 17 18 9 20 21 22 3 4	 Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes. Q Sorry. First, in your understanding, is ALE and ALD used interchangeably? A Yes. Q Okay. So if I'm referring to an ALD window, even though it says ALE window, you understand they are the same? A Yes. Q So are you familiar with a concept of an ALD window? A Yes. Q What is an ALD window? A So when you optimize the ALD process, one of the knobs you can adjust is the temperature of the substrate. And the other one is the nerver advent of the substrate. 	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24	 Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window. Q And within that window, the rate of growth won't be dependent on the temperature; is that correct? MR. LANG: Objection to form. THE WITNESS: The increase of the thickness there would be no change of the thickness because of in that growth cycle as a function of temperature. BY MR. LEN: Q Within the window? A Within the temperature window, yes. Q So I think following up on what we were just discussing, Doctor, if I can direct your attention to Paragraph 46 of your doctement.
$ \begin{array}{c} 1\\2\\3\\4\\5\\6\\7\\8\\9\\10\\11\\12\\13\\14\\15\\16\\17\\18\\9\\20\\21\\22\\3\\24\\25\end{array} $	 Page 28 limiting, but it does not necessarily have to be. BY MR. LEN: Q And you see right below that sentence there's it continues on with a paren that says: Describing self controlled processes in the, quote, ALE window. Do you see that? A Yes. Q Sorry. First, in your understanding, is ALE and ALD used interchangeably? A Yes. Q Okay. So if I'm referring to an ALD window, even though it says ALE window, you understand they are the same? A Yes. Q So are you familiar with a concept of an ALD window? A Yes. Q What is an ALD window? A So when you optimize the ALD process, one of the knobs you can adjust is the temperature of the substrate. And the other one is the precursor dose on the surface of the substrate the data heim them a base of the substrate. 	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25	 Page 29 molecules impinging on the surface per unit area. So by ALE or ALD window, you're talking about choosing substrate temperatures and a dose where the growth may be self limiting. BY MR. LEN: Q Within that window; correct? A Within that window. Q And within that window, the rate of growth won't be dependent on the temperature; is that correct? MR. LANG: Objection to form. THE WITNESS: The increase of the thickness there would be no change of the thickness because of in that growth cycle as a function of temperature. BY MR. LEN: Q Within the window? A Within the temperature window, yes. Q So I think following up on what we were just discussing, Doctor, if I can direct your attention to Paragraph 46 of your declaration.

I

	rage 50		Page 31
1	O So we were just discussing the ALD	1	A It all depends on the context. But in
2	window and the ability for a process to be self	2	many cases ALD processes can be run at lower
3	limiting. Do you agree that's a key difference	3	substrate temperatures than CVD.
4	between ALD and CVD?	4	O Any other differences that you can
5	MR. LANG: Objection to form.	5	think of?
6	THE WITNESS: Yes that is one key	6	A Not off the top of my head
7	difference between AI D and CVD	7	0 Okay So Doctor we were talking
, 8	BY MR I FN.	, R	about gas phase reactions and I think you
9	0 What are the other key differences	a	mentioned homogeneous reaction, nucleation
10	between ALD and CVD?	10	reactions
11	A Well ALD in many cases gives you		Let me turn your attention to the
12	hotter coverage over better step coverage		nloss in your destantion that you mention that
12 12	when you have tonography on the surface for		place in your declaration that you mention that,
14	when you have topography on the surface, for		Paragraph 59 on Page 27.
14	instance.		A Yes, I see that.
15	Q And why does ALD give better step		Q You talked about generally gas phase
16	coverage?		reactions are not desirable I think before.
17	A It can give better step coverage	L./	Is there strike that.
18	because the ALD process is controlled by surface	18	I guess generally is there a risk of
19	reactions to a greater degree than many CVD	19	gas phase reactions in ALD?
20	processes. CVD can also give you good step	20	A No. What we are talking about here is
21	coverage. It depends on the growth parameters	21	various gas phase nucleation. There is a
22	of CVD.	22	difference.
23	Q Are there any other differences	23	So in CVD, you can have gas phase
24	between self limiting and good step coverage	24	reactions. But you don't want it to go all the
25	between CVD and ALD?	25	way to completion leading to the formation of
	Page 32		Page 33
1	Page 32		Page 33
1	Page 32 the final product in the gas phase. That's	1	Page 33 Paragraph 45?
1 2	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you	1 2	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of
1 2 3	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the	1 2 3	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case
1 2 3 4	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film.	1 2 3 4	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide.
1 2 3 4 5	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film?	1 2 3 4 5	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce
1 2 3 4 5 6	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly.	1 2 3 4 5 6	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And
1 2 3 4 5 6 7	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good	1 2 3 4 5 6 7	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it
1 2 3 4 5 6 7 8	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film?	1 2 3 4 5 6 7 8	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface.
1 2 3 4 5 6 7 8 9	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right.	1 2 3 4 5 6 7 8 9	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a
1 2 3 4 5 6 7 8 9 10	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I	1 2 3 4 5 6 7 8 9 10	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer.
1 2 3 4 5 6 7 8 9 10 11	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I think you have a good image here in your	1 2 3 4 5 6 7 8 9 10 11	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer. And then you remove the excess zinc
1 2 3 4 5 6 7 8 9 10 11 12	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I think you have a good image here in your declaration if we start around Paragraph 45.	1 2 3 4 5 6 7 8 9 10 11 12	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer. And then you remove the excess zinc chloride, you purge the chamber of the excess,
1 2 3 4 5 6 7 8 9 10 11 12 13	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I think you have a good image here in your declaration if we start around Paragraph 45. And just before we do that, so the	1 2 3 4 5 6 7 8 9 10 11 12 13	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer. And then you remove the excess zinc chloride, you purge the chamber of the excess, then you flow in reactant Number 2, which is
1 2 3 4 5 6 7 8 9 10 11 12 13 14	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I think you have a good image here in your declaration if we start around Paragraph 45. And just before we do that, so the isn't it true that the risk of gas phase	1 2 3 4 5 6 7 8 9 10 11 12 13 14	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer. And then you remove the excess zinc chloride, you purge the chamber of the excess, then you flow in reactant Number 2, which is hydrogen sulfide, which reacts with the zinc
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I think you have a good image here in your declaration if we start around Paragraph 45. And just before we do that, so the isn't it true that the risk of gas phase nucleation is reduced in ALD because the	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer. And then you remove the excess zinc chloride, you purge the chamber of the excess, then you flow in reactant Number 2, which is hydrogen sulfide, which reacts with the zinc chloride, leading to the formation of zinc
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I think you have a good image here in your declaration if we start around Paragraph 45. And just before we do that, so the isn't it true that the risk of gas phase nucleation is reduced in ALD because the reactants are introduced alternately? Is that	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer. And then you remove the excess zinc chloride, you purge the chamber of the excess, then you flow in reactant Number 2, which is hydrogen sulfide, which reacts with the zinc chloride, leading to the formation of zinc sulfide, and HCL, which are actually two
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I think you have a good image here in your declaration if we start around Paragraph 45. And just before we do that, so the isn't it true that the risk of gas phase nucleation is reduced in ALD because the reactants are introduced alternately? Is that true?	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer. And then you remove the excess zinc chloride, you purge the chamber of the excess, then you flow in reactant Number 2, which is hydrogen sulfide, which reacts with the zinc chloride, leading to the formation of zinc sulfide, and HCL, which are actually two molecules of HCL. You have to balance the
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I think you have a good image here in your declaration if we start around Paragraph 45. And just before we do that, so the isn't it true that the risk of gas phase nucleation is reduced in ALD because the reactants are introduced alternately? Is that true? A That's correct.	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer. And then you remove the excess zinc chloride, you purge the chamber of the excess, then you flow in reactant Number 2, which is hydrogen sulfide, which reacts with the zinc chloride, leading to the formation of zinc sulfide, and HCL, which are actually two molecules of HCL. You have to balance the reaction.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I think you have a good image here in your declaration if we start around Paragraph 45. And just before we do that, so the isn't it true that the risk of gas phase nucleation is reduced in ALD because the reactants are introduced alternately? Is that true? A That's correct. Q And you mentioned purging, that helps	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer. And then you remove the excess zinc chloride, you purge the chamber of the excess, then you flow in reactant Number 2, which is hydrogen sulfide, which reacts with the zinc chloride, leading to the formation of zinc sulfide, and HCL, which are actually two molecules of HCL. You have to balance the reaction. You purge that out, leading to the
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I think you have a good image here in your declaration if we start around Paragraph 45. And just before we do that, so the isn't it true that the risk of gas phase nucleation is reduced in ALD because the reactants are introduced alternately? Is that true? A That's correct. Q And you mentioned purging, that helps it as well?	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer. And then you remove the excess zinc chloride, you purge the chamber of the excess, then you flow in reactant Number 2, which is hydrogen sulfide, which reacts with the zinc chloride, leading to the formation of zinc sulfide, and HCL, which are actually two molecules of HCL. You have to balance the reaction. You purge that out, leading to the formation of a monolayer or a fraction of a
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I think you have a good image here in your declaration if we start around Paragraph 45. And just before we do that, so the isn't it true that the risk of gas phase nucleation is reduced in ALD because the reactants are introduced alternately? Is that true? A That's correct. Q And you mentioned purging, that helps it as well? A Right.	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer. And then you remove the excess zinc chloride, you purge the chamber of the excess, then you flow in reactant Number 2, which is hydrogen sulfide, which reacts with the zinc chloride, leading to the formation of zinc sulfide, and HCL, which are actually two molecules of HCL. You have to balance the reaction. You purge that out, leading to the formation of a monolayer or a fraction of a monolayer of zinc sulfide shown in step 4.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I think you have a good image here in your declaration if we start around Paragraph 45. And just before we do that, so the isn't it true that the risk of gas phase nucleation is reduced in ALD because the reactants are introduced alternately? Is that true? A That's correct. Q And you mentioned purging, that helps it as well? A Right. Q So back to your example here in	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer. And then you remove the excess zinc chloride, you purge the chamber of the excess, then you flow in reactant Number 2, which is hydrogen sulfide, which reacts with the zinc chloride, leading to the formation of zinc sulfide, and HCL, which are actually two molecules of HCL. You have to balance the reaction. You purge that out, leading to the formation of a monolayer or a fraction of a monolayer of zinc sulfide shown in step 4. And then you repeat the process. So
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I think you have a good image here in your declaration if we start around Paragraph 45. And just before we do that, so the isn't it true that the risk of gas phase nucleation is reduced in ALD because the reactants are introduced alternately? Is that true? A That's correct. Q And you mentioned purging, that helps it as well? A Right. Q So back to your example here in Paragraph 45 on Page 20 of your declaration	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer. And then you remove the excess zinc chloride, you purge the chamber of the excess, then you flow in reactant Number 2, which is hydrogen sulfide, which reacts with the zinc chloride, leading to the formation of zinc sulfide, and HCL, which are actually two molecules of HCL. You have to balance the reaction. You purge that out, leading to the formation of a monolayer or a fraction of a monolayer of zinc sulfide shown in step 4. And then you repeat the process. So you go back to step 1, you introduce zinc
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I think you have a good image here in your declaration if we start around Paragraph 45. And just before we do that, so the isn't it true that the risk of gas phase nucleation is reduced in ALD because the reactants are introduced alternately? Is that true? A That's correct. Q And you mentioned purging, that helps it as well? A Right. Q So back to your example here in Paragraph 45 on Page 20 of your declaration, which is Exhibit Number 2 can you walk me	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer. And then you remove the excess zinc chloride, you purge the chamber of the excess, then you flow in reactant Number 2, which is hydrogen sulfide, which reacts with the zinc chloride, leading to the formation of zinc sulfide, and HCL, which are actually two molecules of HCL. You have to balance the reaction. You purge that out, leading to the formation of a monolayer or a fraction of a monolayer of zinc sulfide shown in step 4. And then you repeat the process. So you go back to step 1, you introduce zinc chloride again and so on and so forth.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25	Page 32 the final product in the gas phase. That's called gas phase homogeneous nucleation. So you don't want a snowfall of these particles on the film. Q To create like a powder on the film? A Exactly. Q That wouldn't be considered a good deposition film? A Right. Q Thinking about an ideal ALD process, I think you have a good image here in your declaration if we start around Paragraph 45. And just before we do that, so the isn't it true that the risk of gas phase nucleation is reduced in ALD because the reactants are introduced alternately? Is that true? A That's correct. Q And you mentioned purging, that helps it as well? A Right. Q So back to your example here in Paragraph 45 on Page 20 of your declaration, which is Exhibit Number 2, can you walk me through the images here that you dicplay in	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25	Page 33 Paragraph 45? A Sure. Here we're looking at ALD of zinc sulfide and the two reactants in this case are zinc chloride and hydrogen sulfide. So the first step is you introduce reactant Number 1, which is zinc chloride. And as shown in the first figure labeled 1, it chemisorbs or maybe physisorbs on the surface. And it forms a monolayer or a fraction of a monolayer. And then you remove the excess zinc chloride, you purge the chamber of the excess, then you flow in reactant Number 2, which is hydrogen sulfide, which reacts with the zinc chloride, leading to the formation of zinc sulfide, and HCL, which are actually two molecules of HCL. You have to balance the reaction. You purge that out, leading to the formation of a monolayer or a fraction of a monolayer of zinc sulfide shown in step 4. And then you repeat the process. So you go back to step 1, you introduce zinc chloride again and so on and so forth.

	Page 34		Page 35
1	layer step 1, you mentioned chemisorb and	1	O When you get down to step 4, do you
2	physisorb: is that correct?	2	agree that ideally as represented in this
3	A Yes.	3	simplified diagrams here that after a cycle, a
4	O What is the difference between	4	monolaver of growth is expected or monolaver of
5	chemisorb and physisorb?	5	deposition is expected?
6	A So in chemisorption you're talking	6	MR. LANG: Objection to form.
7	about forming some sort of a chemical bond in	7	THE WITNESS: Ideally you get a
8	this case between the zinc chloride molecules	8	monolayer, but in many cases you don't due
9	and on the surface.	9	to what are called steric hindrances.
10	Now, the very first step would be the	10	BY MR. LEN:
11	surface of the substrate that you're depositing	11	O And I was going to direct you to that.
12	on, but once the reaction starts, the surface	12	I think it's Paragraph 47 of your declaration.
13	would be zinc sulfide.	13	A Yes. I see that.
14	So in this case you're talking about	14	O So as you mentioned, steric
15	chemisorption, chemical bond formation between	15	hinderance, you would agree that due to the
16	zinc chloride molecules and zinc sulfide as a	16	steric hindrance, you may get less than a
17	reaction to seeds. On the other hand, when you	17	monolayer of growth during ALD: correct?
18	talk about physisorption, you are talking about	18	A That's correct.
19	weaker bonding, things like Van Der Waals	19	O Is there ever any cases where you
20	interactions perhaps.	20	would get more than a monolayer of growth during
21	So you have this physical	21	ALD?
22	physisorption between zinc dichloride and the	22	A You could. That depends on the
23	zinc sulfide in this case. Once again, the	23	details of the molecules that are being
24	details depend on what type of film and what	24	absorbed.
25	kind of chemistry you're looking at.	25	O For example, what type of details

A Well, if you're outside of the window, for instance, if you have higher substrate temperatures, for example, you could certainly have CVD processes taking over. Q Okay. And what happens if you're below the lower limit of the temperature in the ALD window? A Once again, you could have things like perhaps condensation of the molecules. Q Anything else? A You can also get less growth than you
1 2 3 4 5 6 7 8 9 10 11 2 13 14 15 16 17 18	 Page 36 would it depend on? A It will depend on the constitution of the molecule and the ligands or the chemical groups that are attached to the molecule. Q You mentioned ligands that are attached to the molecule. In your understanding, what is a ligand? A A ligand is a group of atoms that are attached to another atom or group of atoms. Q I am a mechanical engineer. Would it be fair to call it like a building block of the molecule? A I like that terminology and I very often think of organic chemistry as Lego building blocks. So I think it's a good analogy. Q All right. So earlier, Doctor, we were talking about the ALD window. Isn't it 	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	 page 37 question, please. MR. LEN: I'll rephrase. BY MR. LEN: Q Doctor, we talked about the ALD window. What happens in a process if you're outside of the ALD window? A Well, if you're outside of the window, for instance, if you have higher substrate temperatures, for example, you could certainly have CVD processes taking over. Q Okay. And what happens if you're below the lower limit of the temperature in the ALD window? A Once again, you could have things like perhaps condensation of the molecules. Q Anything else? A You can also get less growth than you would get during when you're in the ALD window
1 2 3 4 5 6 7 8 9 10 11 2 3 14 15 16 17 18 9	 Page 36 would it depend on? A It will depend on the constitution of the molecule and the ligands or the chemical groups that are attached to the molecule. Q You mentioned ligands that are attached to the molecule. In your understanding, what is a ligand? A A ligand is a group of atoms that are attached to another atom or group of atoms. Q I am a mechanical engineer. Would it be fair to call it like a building block of the molecule? A I like that terminology and I very often think of organic chemistry as Lego building blocks. So I think it's a good analogy. Q All right. So earlier, Doctor, we were talking about the ALD window. Isn't it true that in some cases precursors can be 	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	 page 37 question, please. MR. LEN: I'll rephrase. BY MR. LEN: Q Doctor, we talked about the ALD window. What happens in a process if you're outside of the ALD window? A Well, if you're outside of the window, for instance, if you have higher substrate temperatures, for example, you could certainly have CVD processes taking over. Q Okay. And what happens if you're below the lower limit of the temperature in the ALD window? A Once again, you could have things like perhaps condensation of the molecules. Q Anything else? A You can also get less growth than you would get during when you're in the ALD window because for chemical reactions, you often have
1 2 3 4 5 6 7 8 9 10 11 23 14 15 16 17 8 9 20	 Page 36 would it depend on? A It will depend on the constitution of the molecule and the ligands or the chemical groups that are attached to the molecule. Q You mentioned ligands that are attached to the molecule. In your understanding, what is a ligand? A A ligand is a group of atoms that are attached to another atom or group of atoms. Q I am a mechanical engineer. Would it be fair to call it like a building block of the molecule? A I like that terminology and I very often think of organic chemistry as Lego building blocks. So I think it's a good analogy. Q All right. So earlier, Doctor, we were talking about the ALD window. Isn't it true that in some cases precursors can be alternately introduced into a reaction chamber, 	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	Page 37 question, please. MR. LEN: I'll rephrase. BY MR. LEN: Q Doctor, we talked about the ALD window. What happens in a process if you're outside of the ALD window? A Well, if you're outside of the window, for instance, if you have higher substrate temperatures, for example, you could certainly have CVD processes taking over. Q Okay. And what happens if you're below the lower limit of the temperature in the ALD window? A Once again, you could have things like perhaps condensation of the molecules. Q Anything else? A You can also get less growth than you would get during when you're in the ALD window because for chemical reactions, you often have to overcome what's known as an activation
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 9 20 21	 Page 36 would it depend on? A It will depend on the constitution of the molecule and the ligands or the chemical groups that are attached to the molecule. Q You mentioned ligands that are attached to the molecule. In your understanding, what is a ligand? A A ligand is a group of atoms that are attached to another atom or group of atoms. Q I am a mechanical engineer. Would it be fair to call it like a building block of the molecule? A I like that terminology and I very often think of organic chemistry as Lego building blocks. So I think it's a good analogy. Q All right. So earlier, Doctor, we were talking about the ALD window. Isn't it true that in some cases precursors can be alternately introduced into a reaction chamber, but due to the process conditions, the process 	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	Page 37 question, please. MR. LEN: I'll rephrase. BY MR. LEN: Q Doctor, we talked about the ALD window. What happens in a process if you're outside of the ALD window? A Well, if you're outside of the window, for instance, if you have higher substrate temperatures, for example, you could certainly have CVD processes taking over. Q Okay. And what happens if you're below the lower limit of the temperature in the ALD window? A Once again, you could have things like perhaps condensation of the molecules. Q Anything else? A Well, if you're outside of the window, for instance, if you have higher substrate temperatures, for example, you could certainly have CVD processes taking over. Q Okay. And what happens if you're below the lower limit of the temperature in the ALD window? A Once again, you could have things like perhaps condensation of the molecules. Q Anything else? A You can also get less growth than you would get during when you're in the ALD window because for chemical reactions, you often have to overcome what's known as an activation barrier. So if you're below the ALD window in terms of temperature, the molecules cannot have enough thermal energy to go over the barrier and that would preclude those chemical reactions on

10 (Pages 34 to 37)

1	the surface from happening.	1	Q Is that what you're referring to in
2	Q So we just mentioned if we're in the	2	your last answer?
3	condition of being higher than the ALD	3	A Yes.
4	temperature window, that you could have the	4	O And you mentioned that the
5	condition of a CVD process taking over; is that	5	decomposition of the film will not lead to the
б	correct?	6	deposition of a film with the right chemical
7	MR. LANG: Objection to form.	7	composition. What did you mean by that?
8	THE WITNESS: It depends on the	8	A So hypothetically, if we go back to
9	specifics. So if you're running an ALD	9	the example shown in Paragraph 45 of my
10	process, as I mentioned before, you	10	declaration, and I'm flowing in the zinc
11	typically don't introduce all of the	11	dichloride, but I'm operating at a temperature
12	reactants simultaneously.	12	higher than the ALD window this is a
13	BY MR. LEN:	13	hypothetical I'm not sure exactly what the
14	O Right.	14	chemical reactions would be in this case what
15	A So then if I'm running trying to	15	could happen is the zinc dichloride molecules
16	run an ALD process but I have exceeded the	16	might decompose leading to the deposition of a
17	temperature of the ALD window that may lead to	17	film of zinc which has a different composition
18	the decomposition decision of that particular	18	than the zinc sulfide in this case
19	reactant but in general that will not lead to	19	Ω Following along that of the film with
20	the deposition of a film with the right chemical	20	a different chemical composition is it
21	composition or stoichiometry	21	desirable to avoid thermal decomposition?
22	Ω And you mentioned decomposition with	22	Λ It depends on what you mean by that
22	reactant Are you familiar with the term	22	It depends on the context
24	"thermal decomposition"?	23	O Understood Let me rephrase
25	ΔV_{PS}	25	If your goal is to produce a
25	A 103.	25	If your goal is to produce a
	Page 40		Page 41
1	particular film with a particular chamical	1	chamber separate from the reaction chamber. In
2	composition it would follow that it's desirable		some sort of a cylinder perhaps. You don't want
3	to avoid thermal decomposition which would as	2	those precursor molecules to fall apart when
4	vou stated would result in a different		they are being stored in the storage chamber
т 5	composition: is that correct?		for example. That would be an example of how
5	MP I ANG: Objection form	6	thermal stability plays a role
7	THE WITNESS: Are we talking about an		O Does thermal stability also play a
, 8	ALD process or CVD process?		role during deposition process?
a	RV MD I EN:	0 0	A Yee
10	O We can start with an ALD process	10	A 105. O Just thermal stability play a role in
11	A If it's an ALD process that you're		Whather or not thermal decomposition occurs?
12	after you would not want such a high		
13	temperature that you have a lot of thermal	12	A 105. O What role does it play in whather or
14	decomposition that goes on But in many		not thermal decomposition occurs?
15	prostical cases a little bit of thermal		A So in concerct as a molecula is more
16	decomposition may be tolerable	16	A So III general, as a molecule is mole
17	Q Understood In going healt to our		and more thermally decompose it
10	Q Understood. In going back to our		narder to thermany decompose it.
10	So following up on our lost		Q In your opinion, now is the thermal
19	So following up on our last	19	stability of a molecule often reported?
∠U 01	statements, are you familiar with the term		A well, in my lab we talk about it in
∠⊥ 2.2	A Mar		terms of, for example, the shelf life of the
22	A Yes	1 22	molecule. You must notice, of course, that they
~ ~	$\mathbf{O} = \mathbf{A} \mathbf{a} 1^{T} \mathbf{a} 1^{T} \mathbf{a} \mathbf{a} \mathbf{a} \mathbf{a} \mathbf{a} \mathbf{b} \mathbf{b}$		
23	Q And in the context of ALD precursors,	23	store the precursors in the storage chamber,
23 24 25	Q And in the context of ALD precursors, what is your understanding of thermal stability?	23 24 25	store the precursors in the storage chamber, typically those would be at a lower temperature the next in temperature
23 24 25	Q And in the context of ALD precursors, what is your understanding of thermal stability? A So the precursors are stored in a	23 24 25	store the precursors in the storage chamber, typically those would be at a lower temperature than the reaction temperature.

11 (Pages 38 to 41)

Page 39

	Page 42		Page 43
1	O Okay. And do you ever talk about	1	stability to not degrade under the ALD process
2	thermal stability in terms of melting points of	2	conditions and by let me rephrase. By
3	that molecule?	3	degrade. I mean enter into thermal
4	A I mean, if it's a solid precursor that	4	decomposition.
5	you're talking about, you talk about melting	5	A Yes. I mean, you would want the
6	point in that context.	6	molecule to be sufficiently stable such that
7	Q Does boiling point of a molecule play	7	there is not a whole lot of thermal
8	into the thermal stability?	8	decomposition within that ALD window.
9	A So in many cases the precursors are	9	O And typically during an ALD process,
10	liquids, say at ambient temperature, in that	10	the substrate would be at the same temperature
11	case the boiling point plays a role, of course.	11	within the ALD window; is that correct?
12	Q And so just to sum it up to come back,	12	A And the substrate temperature is what
13	you would agree that for hypothetical ideal ALD	13	you're talking about the ALD window?
14	process, it would be desirable for the precursor	14	Q Just to clarify.
15	to exhibit sufficient thermal stability to avoid	15	À Yes.
16	thermal decomposition during an ALD process; is	16	Q All right. If we can direct your
17	that correct?	17	attention to Paragraph 57 of Exhibit Number 2.
18	MR. LANG: Objection to form.	18	Are you ready?
19	THE WITNESS: You would want the	19	A Yes.
20	precursor molecule to have enough thermal	20	Q So in this Paragraph 57, you identify
21	stability such that it does not degrade	21	a number of different qualities that
22	under ambient temperature conditions, for	22	characterize a desirable precursor for ALD; is
23	example, so that you have enough shelf life.	23	that correct?
24	BY MR. LEN:	24	A Yes.
25	Q What about having enough thermal	25	Q If you see the third sentence in this
	2 11		
	rage ii		Page 45
1	paragraph you state: These include reactivity	1	is that correct?
1 2	paragraph you state: These include reactivity towards surface ligands, thermal stability	1 2	Page 45 is that correct? A That's correct.
1 2 3	paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in	1 2 3	Page 45 is that correct? A That's correct. Q So for a person to design an ALD
1 2 3 4	paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between	1 2 3 4	Page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the
1 2 3 4 5	paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between vaporization temperature and decomposition	1 2 3 4 5	Page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the reactivities of the particular molecules; is
1 2 3 4 5 6	paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between vaporization temperature and decomposition temperature.	1 2 3 4 5 6	Page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the reactivities of the particular molecules; is that correct?
1 2 3 4 5 6 7	paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between vaporization temperature and decomposition temperature. Do you see that?	1 2 3 4 5 6 7	Page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the reactivities of the particular molecules; is that correct? MR. LANG: Objection, form.
1 2 3 4 5 6 7 8	paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between vaporization temperature and decomposition temperature. Do you see that? A Yes.	1 2 3 4 5 6 7 8	Page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the reactivities of the particular molecules; is that correct? MR. LANG: Objection, form. THE WITNESS: Yes, you would have to
1 2 3 4 5 6 7 8 9	paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between vaporization temperature and decomposition temperature. Do you see that? A Yes. Q Let's walk through each one of these.	1 2 3 4 5 6 7 8 9	Page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the reactivities of the particular molecules; is that correct? MR. LANG: Objection, form. THE WITNESS: Yes, you would have to know what the chemistries are.
1 2 3 4 5 6 7 8 9 10	paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between vaporization temperature and decomposition temperature. Do you see that? A Yes. Q Let's walk through each one of these. So the first desirable quality you	1 2 3 4 5 6 7 8 9 10	Page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the reactivities of the particular molecules; is that correct? MR. LANG: Objection, form. THE WITNESS: Yes, you would have to know what the chemistries are. BY MR. LEN:
1 2 3 4 5 6 7 8 9 10 11	paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between vaporization temperature and decomposition temperature. Do you see that? A Yes. Q Let's walk through each one of these. So the first desirable quality you list is reactivity towards surface ligands.	1 2 3 4 5 6 7 8 9 10 11	Page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the reactivities of the particular molecules; is that correct? MR. LANG: Objection, form. THE WITNESS: Yes, you would have to know what the chemistries are. BY MR. LEN: Q And then not only what the chemistries are but whether or not they be page 45
1 2 3 4 5 6 7 8 9 10 11 12	paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between vaporization temperature and decomposition temperature. Do you see that? A Yes. Q Let's walk through each one of these. So the first desirable quality you list is reactivity towards surface ligands. Now, we mentioned surface ligands earlier as these building blocks	1 2 3 4 5 6 7 8 9 10 11 12	Page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the reactivities of the particular molecules; is that correct? MR. LANG: Objection, form. THE WITNESS: Yes, you would have to know what the chemistries are. BY MR. LEN: Q And then not only what the chemistries are, but whether or not they're reactive with each other is that correct?
1 2 3 4 5 6 7 8 9 10 11 12 13	 paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between vaporization temperature and decomposition temperature. Do you see that? A Yes. Q Let's walk through each one of these. So the first desirable quality you list is reactivity towards surface ligands. Now, we mentioned surface ligands earlier as these building blocks. 	1 2 3 4 5 6 7 8 9 10 11 12 13	Page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the reactivities of the particular molecules; is that correct? MR. LANG: Objection, form. THE WITNESS: Yes, you would have to know what the chemistries are. BY MR. LEN: Q And then not only what the chemistries are, but whether or not they're reactive with each other; is that correct?
1 2 3 4 5 6 7 8 9 10 11 12 13 14	 paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between vaporization temperature and decomposition temperature. Do you see that? A Yes. Q Let's walk through each one of these. So the first desirable quality you list is reactivity towards surface ligands. Now, we mentioned surface ligands earlier as these building blocks. What exactly do you mean when you say 	1 2 3 4 5 6 7 8 9 10 11 12 13 14	Page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the reactivities of the particular molecules; is that correct? MR. LANG: Objection, form. THE WITNESS: Yes, you would have to know what the chemistries are. BY MR. LEN: Q And then not only what the chemistries are, but whether or not they're reactive with each other; is that correct? A That's part of the chemistry. O Okey. So to follow we with that how
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	 paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between vaporization temperature and decomposition temperature. Do you see that? A Yes. Q Let's walk through each one of these. So the first desirable quality you list is reactivity towards surface ligands. Now, we mentioned surface ligands earlier as these building blocks. What exactly do you mean when you say reactivity towards surface ligands? 	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	 Page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the reactivities of the particular molecules; is that correct? MR. LANG: Objection, form. THE WITNESS: Yes, you would have to know what the chemistries are. BY MR. LEN: Q And then not only what the chemistries are, but whether or not they're reactive with each other; is that correct? A That's part of the chemistry. Q Okay. So to follow up with that, how do won know if the argenting of the particular to the process.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	 paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between vaporization temperature and decomposition temperature. Do you see that? A Yes. Q Let's walk through each one of these. So the first desirable quality you list is reactivity towards surface ligands. Now, we mentioned surface ligands earlier as these building blocks. What exactly do you mean when you say reactivity towards surface ligands? A So in the example that we talked about a few minutes carlier at the section of the section	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	 Page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the reactivities of the particular molecules; is that correct? MR. LANG: Objection, form. THE WITNESS: Yes, you would have to know what the chemistries are. BY MR. LEN: Q And then not only what the chemistries are, but whether or not they're reactive with each other; is that correct? A That's part of the chemistry. Q Okay. So to follow up with that, how do you know if the precursors will be reactive to the surface linear do?
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	 paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between vaporization temperature and decomposition temperature. Do you see that? A Yes. Q Let's walk through each one of these. So the first desirable quality you list is reactivity towards surface ligands. Now, we mentioned surface ligands earlier as these building blocks. What exactly do you mean when you say reactivity towards surface ligands? A So in the example that we talked about a few minutes earlier, talking about deposition of ring culfide thin films. So at the and of the 	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	 page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the reactivities of the particular molecules; is that correct? MR. LANG: Objection, form. THE WITNESS: Yes, you would have to know what the chemistries are. BY MR. LEN: Q And then not only what the chemistries are, but whether or not they're reactive with each other; is that correct? A That's part of the chemistry. Q Okay. So to follow up with that, how do you know if the precursors will be reactive towards the surface ligands?
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	 paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between vaporization temperature and decomposition temperature. Do you see that? A Yes. Q Let's walk through each one of these. So the first desirable quality you list is reactivity towards surface ligands. Now, we mentioned surface ligands earlier as these building blocks. What exactly do you mean when you say reactivity towards surface ligands? A So in the example that we talked about a few minutes earlier, talking about deposition of zinc sulfide thin films, so at the end of the cycle. 	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	 page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the reactivities of the particular molecules; is that correct? MR. LANG: Objection, form. THE WITNESS: Yes, you would have to know what the chemistries are. BY MR. LEN: Q And then not only what the chemistries are, but whether or not they're reactive with each other; is that correct? A That's part of the chemistry. Q Okay. So to follow up with that, how do you know if the precursors will be reactive towards the surface ligands? A Well, there is a lot of information that you can gleap for avanual.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	 paragraph you state: These include reactivity towards surface ligands, thermal stability against decomposition at ambient temperatures in volatility within adequate the window between vaporization temperature and decomposition temperature. Do you see that? A Yes. Q Let's walk through each one of these. So the first desirable quality you list is reactivity towards surface ligands. Now, we mentioned surface ligands earlier as these building blocks. What exactly do you mean when you say reactivity towards surface ligands? A So in the example that we talked about a few minutes earlier, talking about deposition of zinc sulfide thin films, so at the end of the cycle, suppose the top layer consists of sulfur a size. 	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	 page 45 is that correct? A That's correct. Q So for a person to design an ALD process, it's important that they understand the reactivities of the particular molecules; is that correct? MR. LANG: Objection, form. Q Is the breakage of the weak bonds and the strong bonds, is that easily predictable? MR. LANG: Objection, form. THE WITNESS: As I told you, there are many chemical handbooks where you can look up chemical bond strengths. And a lot of these have been measured experimentally. But it uses powerful theoretical techniques also that might reduce it also where you can calculate these bonds using quantum chemistry, the standard software that people use to calculate these.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	 BY MR. LEN: Q Okay. So just following up, we talked last just about the structure of the molecule, but prior to that we talked about the bond strength and that the weak bonds might be broken first. How would one of skill in the art know whether the strong bonds are also broken? A I mean, it would depend on the relative bond strength. So if the stronger bonds were only slightly stronger than the weaker bonds, then there will probably be a competition where both sets of bonds break to a certain degree. How much breakage there is of the bonds would obviously also depend on the temperature. Q Right. A In fact, most of these chemical reactions have a many of these chemical reactions have an exponential dependence on 	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	 Q Would the ratio of the breakage of the weak bonds to the strong bonds depend on anything else beyond the temperature dependence? A The temperature would be one of the main parameters. There may be other things depending on the specifics of the reaction that you're looking at. Q Is the breakage of the weak bonds and the strong bonds, is that easily predictable? MR. LANG: Objection, form. 13 (Pages 46 to 49)

	Page 50		Page 51
1	that my group uses and many chemists use and	1	BY MR. LEN:
2	many other groups use as one example.	2	Q Right before we left, we were talking
3	Q And that theory is supported often	3	about your Paragraph 57 in your declaration for
4	with actual testing; is that true?	4	the '539 patent which is in support of the 662
5	A You always would like to correlate	5	IPR petition. And specifically Paragraph 57
б	thermal activity with external data, yes.	6	mentions some desirable qualities for precursors
7	Q In fact, the theories have greatly	7	for ALD.
8	improved since the time frame of 2001 until now;	8	We were discussing the reactivity
9	is that true?	9	towards surface ligands before we left, but now
10	MR. LANG: Objection, form.	10	I would like to pick back up on the second
11	THE WITNESS: It depends on exactly	11	quality in that list in Paragraph 57, which is
12	what you are talking about.	12	thermal stability against decomposition at
13	BY MR. LEN:	13	ambient temperatures.
14	Q They fit the actual data better now?	14	Can you tell me a little bit about
15	MR. LANG: Objection to form.	15	what you mean by that?
16	THE WITNESS: In a broad sense, yes.	16	A Sure. So you store the precursors in
17	But it all depends on the specifics.	17	a cylinder, perhaps, and that's generally going
18	MR. LEN: So I think now is a good	18	to be kept at room temperature in most cases.
19	time to go off the record and take a break.	19	So that's what I meant by ambient temperatures.
20	(Recess taken.)	20	But in some cases, if a precursor is
21	THE COURT:	21	very unstable, people might cool the storage
22	MR. LEN: We're back on the record.	22	chamber down to make sure it does not thermally
23	Welcome back, Doctor.	23	decompose while it's being stored.
24	THE WITNESS: Thank you.	24	Q So is it fair to say that thermal
25		25	stability is desirable in ALD precursors?
	Page 52		Page 53

1	A I mean, in terms of the shelf life of	1	precursor molecules to fall apart. That's what
2	the precursor, yes. You don't want it to fall	2	I mean by the temperature window.
3	apart while it's being stored.	3	Q Doctor, can an ALD process be run with
4	Q Similarly, you don't want it to	4	a precursor that does not possess these
5	thermally decompose in an ALD process; correct?	5	qualities as noted here in Paragraph 57?
6	MR. LANG: Objection to form.	6	MR. LANG: Objection to form.
7	THE WITNESS: It depends on the	7	THE WITNESS: These are desirable
8	specifics, but in general, yes.	8	attributes for ALD. I mean, you would have
9	BY MR. LEN:	9	to show me a specific example to comment on
10	Q And if we move on to your next	10	that further.
11	characteristic is volatility with an adequate	11	BY MR. LEN:
12	window between vaporization temperature and	12	Q But if we just let's just focus on
13	decomposition temperature.	13	your last desirable quality. If the precursor
14	Can you tell me a little bit about	14	does not have adequate volatility within the
15	that?	15	window between vaporization and decomposition,
16	A Sure. So you have to transport vapors	16	can you run ALD in that instance?
17	of the precursor from the storage chamber into	17	MR. LANG: Objection to form.
18	the reaction chamber where the substrate is.	18	THE WITNESS: Once again, it would
19	So what that means is you have to have	19	depend on the specifics, but in general, I
20	enough vapor pressure so that the vapors can be	20	agree with the statement that you do need
21	transported at perhaps the ambient temperature	21	suitable temperature window between the
22	or maybe at a somewhat higher temperature. But	22	vaporization temperature and the
23	the temperature at which you have enough vapor	23	decomposition temperature of the molecules.
24	pressure to transport vapors of the reactant	24	BY MR. LEN:
25	should not at the same time cause those	25	Q If the precursor does not have

14 (Pages 50 to 53)

	Page 54		Page 55
1	adequate reactivity towards the surface ligands,	1	Q Just to clarify your previous answer,
2	is it possible to run an ALD process?	2	we indicated that desorption could affect the
3	MR. LANG: Objection to form.	3	deposited layer. And your answer was yes,
4	THE WITNESS: I mean, in general you	4	typically you can't get as much coverage on the
5	would want it to be chemically reactive so	5	surface or you can get as much coverage on the
6	that you have chemisorption. But in some	6	surface?
7	cases I believe you could alternatively have	7	A What I meant was if you have weak
8	physisorption that I mentioned earlier on	8	physisorption the physisorbed molecules might
9	due to weaker Van Der Waals interactions	9	be more prone to reabsorption from the surface
10	between the molecules	10	also
11	BY MR LEN.	11	O Right.
12	O Are the weaker Van Der Waals	12	A So you would not get as much coverage
13	interactions due to for the physisorption	13	on the surface if some of the molecules
14	more prone to desorbing off the surface?	14	desorbed
15	A In general that's true because those	15	\mathbf{O} And then finally just to close it
16	bonds are weaker	16	off isn't it true that without thermal
17	Ω And that would affect the thickness of	17	stability that you're not able to run an ALD
18	the denosited layer: true?	18	process: is that true?
19	A Ves typically you won't get as much	19	A I mean you want the molecules to be
20	coverage on the surface	20	sufficiently thermally stable such that as it's
21	• Would that affect the step coverage	21	being stored, it does not degrade the
22	too?	22	composition in the storage chamber
22	Λ Offhand L cannot think of a reason why	22	And also similarly you would want to
24	it would But you could give me specific	24	have enough thermal stability such that it would
25	examples	25	not unnecessarily thermal decompose during the
25	examples.	25	not unnecessarily merinal decompose during the
	Page 56		Page 57

LEN: Q We've been discussing kind of desired or qualities that we would want for an ALD process. It also follows that there is a certain minimum required or needed for the ALD process to successfully operate; is that true? A I'm not sure what you mean by minimum. Q That's fine. Rephrase. Your last answer we were talking about you want enough thermal stability where you don't get a lot of thermal decomposition within the window. I was just trying to clarify, you	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	Page 57 know, it would depend on the manufacturer, for example, and many other parameters. BY MR. LEN: Q Are there any other qualities that are desirable for ALD precursors beyond the ones that are listed here in Paragraph 57? A I mean, you would not want precursors which might introduce contaminants which could degrade the film that you're depositing. So in the example that I cited where you use chlorine based precursors, in some circumstances, residual chlorine in the film might end up causing corrosion, for instance. So that would not be a desirable thing. Q Are there any other desirable characteristics? A Desirable characteristics in terms of
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	Page 56 ALD process; is that true? MR. LANG: Objection to form. THE WITNESS: You want enough thermal stability where you don't get a lot of thermal decomposition within the ALD window. BY MR. LEN: I'll represent for the record it's 20. THE WITNESS: Okay. BY MR. LEN: Q And then following on after approximately Line 12 after that list, you see

16 (Pages 58 to 61)

TSG Reporting - Worldwide - 877-702-9580

HARVARD Ex. 2121 p. 16 IPR2017-00664

	Page 62		Page 63
1	it states: Which is dissolved, emulsified or	1	alkene?
2	suspended in an inert liquid selected from the	2	A Alkyne.
3	group consisting of.	3	Q Alkyneis the third number in that
4	Do you see that?	4	list. What is that?
5	A Yes.	5	A These are all hydrocarbons.
6	Q And then it goes on to list the inert	6	Q And so we just looked at these
7	liquids; is that true?	7	three first three ligands in this group. Are
8	A Yes.	8	there different types of hydride ligands?
9	Q Then finally, approximately Line 18,	9	A Yes.
10	the last sentence of that paragraph it states:	10	Q Would it be fair to say that there's
11	The precursor source mixture may be a solution,	11	multiple permutations of hydride ligands
12	emulsion or suspension and may consist of a	12	possible?
13	mixture of solid, liquid and gas phases which	13	A There's several, yes.
14	are distributed throughout the mixture.	14	Q How many, do you know?
15	Do you see that?	15	A It depends on what it's attached to,
16	A Yes.	16	but it could have monohydrides or dihydrides.
17	Q So just breaking this down, we've	17	Q Okay. You mentioned monohydrides and
18	looked at the elements first and then we looked	18	dihydrides. Would there be multiple different
19	at the ligands. If we just take the first	19	types of monohydrides?
20	ligand, what is a hydride ligand?	20	A You would have to show me some of the
21	A It's a hydrogen containing group.	21	molecules that you are talking about. Mono
22	Q What is an alkyl ligand?	22	means one hydrogen, di means two, so on and so
23	A This would be like methyl or ethyl	23	forth.
24	groups.	24	Q Just in terms of the ligands, are
20	Q And I might pronounce this wrong, but	20	ulere multiple different types of mononydride
	Page 64		Page 65
1	ligands?	1	O And Buchanan is using this generalized
2	A Offhand I couldn't tell you. You have	2	formula to describe its list of precursors; is
3	to show me specific molecules.	3	that true?
4	Q Just to follow up, are there multiple	4	A Yes.
5	different types of dihydride ligands?	5	Q It's your opinion that each of these
б	A Once again, I could not tell you.	6	precursors describe this generalized formula as
7	Dihydride, like I said, is two hydrogens stuck	7	suitable for both CVD and ALD; true?
8	together. You would have to show me a specific	8	A Yes, in general.
9	formula.	9	Q And when you say in general, what do
10	Q So you mentioned formula. So let's	10	you mean by that?
11	turn to the next page in Buchanan, which is	11	A I mean when you talk about CVD or ALD
12	Column 5. If you look midway down Column 5	12	processes, you cannot divorce the molecule from
13		1 1 2	
	around Line 45, do you see a generalized formula		the deposition conditions. So you would have to
14	around Line 45, do you see a generalized formula for the precursor there?	14	choose appropriate substrate temperature, for
14 15	around Line 45, do you see a generalized formula for the precursor there? A Yes.	14 15	the deposition conditions. So you would have to choose appropriate substrate temperature, for instance.
14 15 16	around Line 45, do you see a generalized formula for the precursor there? A Yes. Q Can you explain to me what that is?	13 14 15 16	the deposition conditions. So you would have to choose appropriate substrate temperature, for instance. Q And that appropriate substrate
14 15 16 17	around Line 45, do you see a generalized formula for the precursor there? A Yes. Q Can you explain to me what that is? A It shows M is one of the elements from	14 15 16 17	the deposition conditions. So you would have to choose appropriate substrate temperature, for instance. Q And that appropriate substrate temperature you just mentioned, that would relate to the ALD mindemum to like defent
14 15 16 17 18	around Line 45, do you see a generalized formula for the precursor there? A Yes. Q Can you explain to me what that is? A It shows M is one of the elements from the list starting Line 46 or so, I guess. And then P1 and P2 they are it could be the sum of the	13 14 15 16 17 18	the deposition conditions. So you would have to choose appropriate substrate temperature, for instance. Q And that appropriate substrate temperature you just mentioned, that would relate to the ALD window we talked about cordion: true?
14 15 16 17 18 19 20	around Line 45, do you see a generalized formula for the precursor there? A Yes. Q Can you explain to me what that is? A It shows M is one of the elements from the list starting Line 46 or so, I guess. And then R1 and R2, they say it could be the same or different ligneds from the group consisting of	13 14 15 16 17 18 19	the deposition conditions. So you would have to choose appropriate substrate temperature, for instance. Q And that appropriate substrate temperature you just mentioned, that would relate to the ALD window we talked about earlier; true?
14 15 16 17 18 19 20 21	around Line 45, do you see a generalized formula for the precursor there? A Yes. Q Can you explain to me what that is? A It shows M is one of the elements from the list starting Line 46 or so, I guess. And then R1 and R2, they say it could be the same or different ligands from the group consisting of alkyls, for example	13 14 15 16 17 18 19 20 21	the deposition conditions. So you would have to choose appropriate substrate temperature, for instance. Q And that appropriate substrate temperature you just mentioned, that would relate to the ALD window we talked about earlier; true? A Yes, in the context of ALD, yes. Q And so if you're outside of the ALD
14 15 16 17 18 19 20 21 22	around Line 45, do you see a generalized formula for the precursor there? A Yes. Q Can you explain to me what that is? A It shows M is one of the elements from the list starting Line 46 or so, I guess. And then R1 and R2, they say it could be the same or different ligands from the group consisting of alkyls, for example.	13 14 15 16 17 18 19 20 21 22	 the deposition conditions. So you would have to choose appropriate substrate temperature, for instance. Q And that appropriate substrate temperature you just mentioned, that would relate to the ALD window we talked about earlier; true? A Yes, in the context of ALD, yes. Q And so if you're outside of the ALD window it would not be appropriate for ALD; is
14 15 16 17 18 19 20 21 22 23	around Line 45, do you see a generalized formula for the precursor there? A Yes. Q Can you explain to me what that is? A It shows M is one of the elements from the list starting Line 46 or so, I guess. And then R1 and R2, they say it could be the same or different ligands from the group consisting of alkyls, for example. And then A is an optional coordinate, it could be bound or associated ligands from the	13 14 15 16 17 18 19 20 21 22 23	 the deposition conditions. So you would have to choose appropriate substrate temperature, for instance. Q And that appropriate substrate temperature you just mentioned, that would relate to the ALD window we talked about earlier; true? A Yes, in the context of ALD, yes. Q And so if you're outside of the ALD window, it would not be appropriate for ALD; is that true?
14 15 16 17 18 19 20 21 22 23 24	around Line 45, do you see a generalized formula for the precursor there? A Yes. Q Can you explain to me what that is? A It shows M is one of the elements from the list starting Line 46 or so, I guess. And then R1 and R2, they say it could be the same or different ligands from the group consisting of alkyls, for example. And then A is an optional coordinate, it could be bound or associated ligands from the phosphine group phosphides. A means A	13 14 15 16 17 18 19 20 21 22 23 24	the deposition conditions. So you would have to choose appropriate substrate temperature, for instance. Q And that appropriate substrate temperature you just mentioned, that would relate to the ALD window we talked about earlier; true? A Yes, in the context of ALD, yes. Q And so if you're outside of the ALD window, it would not be appropriate for ALD; is that true? MR LANG: Objection to form
14 15 16 17 18 19 20 21 22 23 24 25	around Line 45, do you see a generalized formula for the precursor there? A Yes. Q Can you explain to me what that is? A It shows M is one of the elements from the list starting Line 46 or so, I guess. And then R1 and R2, they say it could be the same or different ligands from the group consisting of alkyls, for example. And then A is an optional coordinate, it could be bound or associated ligands from the phosphine group, phosphides. A means A referring to nitrogen and so on and so forth.	13 14 15 16 17 18 19 20 21 22 23 24 25	 the deposition conditions. So you would have to choose appropriate substrate temperature, for instance. THE WITNESS: Well, one knows in general what the desirable attributes for ALD are, as we discussed some time back, right. Mnd you could look at some of these handbooks or sources such as Google or Wikipedia or I believe the university has access to something called the Web of Science. That's one example where you can look at technical literature. Bo there is a lot of information out	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	Page 69 initial guide to try to figure out which precursors might be suitable for certain processes. BY MR. LEN: Q But that information you just mentioned, those handbooks and Wikipedia and Google, that's none of that is disclosed in Buchanan; is that correct? MR. LANG: Objection to form. THE WITNESS: These are things that a person of ordinary skill in my opinion would be familiar with. BY MR. LEN: Q And so a person of ordinary skill would know that in general, not all of the precursors disclosed in Buchanan work for both CVD and ALD; is that true? MR. LANG: Objection to form. THE WITNESS: It all depends on the specifics and the context, of course. BY MR. LEN: Q I apologize.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	Page 68 generic formula are suitable for CVD or ALD. Q And as we discussed before, in general means that there are contexts which some are not suitable for ALD and CVD; is that correct? A I mean, there could be some specific molecules which may not be suitable for one or the other. Q I think I know the answer to this based on our discussion. How would you know if one is not suitable for one or the other? MR. LANG: Objection to form. THE WITNESS: Well, one knows in general what the desirable attributes for ALD are, as we discussed some time back, right. Ma you could look at some of these handbooks or sources such as Google or Wikipedia or I believe the university has access to something called the Web of Science. That's one example where you can look at technical literature. So there is a lot of information out there about, for instance, these chemical	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	 Page 69 initial guide to try to figure out which precursors might be suitable for certain processes. BY MR. LEN: Q But that information you just mentioned, those handbooks and Wikipedia and Google, that's none of that is disclosed in Buchanan; is that correct? MR. LANG: Objection to form. THE WITNESS: These are things that a person of ordinary skill in my opinion would be familiar with. BY MR. LEN: Q And so a person of ordinary skill would know that in general, not all of the precursors disclosed in Buchanan work for both CVD and ALD; is that true? MR. LANG: Objection to form. THE WITNESS: It all depends on the specifics and the context, of course. BY MR. LEN: Q I apologize. A So there could be a few outliers in
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24	Page 68 generic formula are suitable for CVD or ALD. Q And as we discussed before, in general means that there are contexts which some are not suitable for ALD and CVD; is that correct? A I mean, there could be some specific molecules which may not be suitable for one or the other. Q I think I know the answer to this based on our discussion. How would you know if one is not suitable for one or the other? MR. LANG: Objection to form. THE WITNESS: Well, one knows in general what the desirable attributes for ALD are, as we discussed some time back, right. Mn you could look at some of these handbooks or sources such as Google or Wikipedia or I believe the university has access to something called the Web of Science. That's one example where you can look at technical literature. So there is a lot of information out there about, for instance, these chemical bond strengths that we talked about earlier,	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24	Page 69 initial guide to try to figure out which precursors might be suitable for certain processes. BY MR. LEN: Q But that information you just mentioned, those handbooks and Wikipedia and Google, that's none of that is disclosed in Buchanan; is that correct? MR. LANG: Objection to form. THE WITNESS: These are things that a person of ordinary skill in my opinion would be familiar with. BY MR. LEN: Q And so a person of ordinary skill would know that in general, not all of the precursors disclosed in Buchanan work for both CVD and ALD; is that true? MR. LANG: Objection to form. THE WITNESS: It all depends on the specifics and the context, of course. BY MR. LEN: Q I apologize. A So there could be a few outliers in the list of these precursor molecules discussed
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25	<text><text><text><text><text><text><text><text><text></text></text></text></text></text></text></text></text></text>	$ \begin{array}{c} 1\\2\\3\\4\\5\\6\\7\\8\\9\\10\\11\\12\\13\\14\\15\\16\\17\\18\\19\\20\\21\\22\\23\\24\\25\end{array} $	 Page 69 initial guide to try to figure out which precursors might be suitable for certain processes. BY MR. LEN: Q But that information you just mentioned, those handbooks and Wikipedia and Google, that's none of that is disclosed in Buchanan; is that correct? MR. LANG: Objection to form. THE WITNESS: These are things that a person of ordinary skill in my opinion would be familiar with. BY MR. LEN: Q And so a person of ordinary skill would know that in general, not all of the precursors disclosed in Buchanan work for both CVD and ALD; is that true? MR. LANG: Objection to form. THE WITNESS: It all depends on the specifics and the context, of course. BY MR. LEN: Q I apologize. A So there could be a few outliers in the list of these precursor molecules discussed in Buchanan that may not work for one or the

18 (Pages 66 to 69)

	Page 70		Page 71
1	other.	1	attributes. I don't recall if Buchanan
2	O And that depends on the process	2	explicitly talks about some of the other
3	conditions, as we discussed earlier: correct?	3	desirable attributes. If you point me to a
4	MR LANG: Objection form	4	section I can certainly look at it
5	THE WITNESS: I mean when you design	5	Ω That's okay. If we look at the list
6	a CVD or ALD process as I mentioned before	6	of Buchanan preferred precursors if you look at
7	you have the molecules, the procursor		Column 6, do you agree that Column 6 is a list
, 8	molecules working in concert with the	, Q	of proformed procursors according to Puchanan?
0	process foundations, yes		A Vec
10	DV MD LEN.	10	A ites.
11	BY MR. LEN:		Q And in fact, if we continue on through
10	Q So starting with If we can look at		Buchanan, starting in Column 8, Buchanan lists
12	a subset of some of the precursors discussed in		several different categories of preferred
13	Buchanan, I would like to direct your attention	13	precursors, is that correct, one of which is
14	I think to the bottom of Column 5 in Buchanan.	14	shown in Column 8?
15	There's the very last full sentence	15	A Yes.
16	starting on Line 66, do you see that?	16	Q And a preferred precursor category is
17	It states: The preferred precursors	17	hydride containing compounds in Column A; is
18	of the present invention are compounds which are	18	that correct?
19	readily vaporized.	19	A Yes.
20	Do you see that?	20	Q And in fact, if we go through
21	A Yes.	21	return to Column 9, there's preferred precursor
22	Q Do you know, just off the top of your	22	mixtures for alkyl-containing compounds; is that
23	head, if Buchanan gives any further description	23	correct?
24	of what is required to give preferred precursor?	24	A Yes.
25	A This is certainly one of the	25	Q Similarly, Column 11, preferred
	Page 72		Page 73
1	mixtures for alkenyl-containing compounds;	1	A I haven't done the count, but I'll
2	correct?	2	take your word for it.
3	A Yes.	3	Q Within those categories of preferred
4	Q Column 12 is preferred source mixtures	4	precursors, isn't it true that Buchanan
5	for carbonyl-containing compounds; true?	5	identifies some highly preferred precursors?
б	A Yes.	6	A Yes.
7	Q Column 13 is preferred mixtures for	7	Q In your review of Buchanan, did
8	alkoxy-containing compounds; is that true?	8	Buchanan ever state why those precursors are
9	A Yes.	9	highly preferred?
10	Q Column 14 lists preferred mixtures for	10	If I can direct your attention to
11	amino-containing compounds; true?	11	Column 9 for the hydrides, line approximately
12	A Yes.	12	33, there's highly preferred mixtures, I
13	O Column 15 lists preferred mixtures for	13	apologize, for alkyls.
14	phosphido-containing compounds; is that true?	14	A Yes. I see that.
15	A Yes.	15	O But there is no description of why
16	O Column 16 is precursor source mixtures	16	these precursors are highly preferred, is there?
17	for nitrate-containing compounds: true?	17	A Well, a person of ordinary skill would
18	A Yes.	18	know what some of the attractive attributes of
19	O Column 17 lists precursor source	19	ALD precursors are for instance as we
20	mixtures for preferred silvl-containing	20	discussed earlier
21	compounds: is that true?	21	And then as I mentioned if we look at
22	A Yes	22	the list of highly preferred precursors that
22	0 So all told if we count those up	22	Buchanan talks about it would be quite
24	that's ten categories of preferred precursors.	24	straightforward in my opinion to you know look
25	correct?	25	up in standard handbooks or some of the other
-			ap in standard handbooks of some of the other

Q It's cobalt carbonyl; is that true? A Yes. O If we can look back to where we were

20 (Pages 74 to 77)

	Page 78		Page 79
1	at Column 12. I think there is I think we	1	MR. LANG: Objection to form.
2	were looking at the list of precursor source	2	THE WITNESS: You can always choose
3	mixtures for carbonyl-containing compounds?	3	the wrong deposition conditions and the
4	A Yes.	4	process would not work.
5	Q If we look down Line 56 or 57, you see	5	BY MR. LEN:
6	the highly preferred precursor source mixtures	6	Q So if you would direct your attention
7	comprise?	7	back to Column 21 of Buchanan. Approximately
8	A Okay.	8	Line 22, first sentence of that paragraph
9	Q And the third one in that list of	9	states: The precursor source mixtures are
10	carbonyl-containing precursors is the CO2,	10	vaporized at 40 degrees to 260 degrees C,
11	paren, CO, closed paren, 8. Is that cobalt	11	preferably 40 degrees through 180 C.
12	carbonyl?	12	Do you see that?
13	A Yes.	13	A Yes.
14	Q So that's a preferred precursor	14	Q And it follows on: The substrate
15	according to Buchanan; correct?	15	temperature is about 100 degrees through 1200
16	A It's a highly preferred precursor.	16	degrees C and preferably 200 degrees to
17	Q Highly preferred precursor. Do you	17	800 degrees C.
18	know, is that highly preferred for CVD or ALD?	18	Do you see that?
19	A In general in Buchanan they talk about	19	A Yes.
20	highly preferred for both CVD and ALD with the	20	Q Do you know what the thermal
21	caveat that you choose appropriate deposition	21	decomposition of thermal carbonyl is?
22	conditions.	22	A Not off the top of my head.
23	Q So in general, if you don't choose	23	Q As you mentioned before, you would
24	appropriate deposition conditions, it wouldn't	24	look at some of these handbooks typically;
25	be appropriate for ALD; is that correct?	25	correct?
	Page 80		Page 81

21 (Pages 78 to 81)

	Page 82		Page 83
1	Q And you see the second column states	1	MR. LANG: I'll object again to this
2	color, it's orange.	2	line of testimony. I guess it's a form
3	Do you see that?	3	objection, but it's based on the
4	A Yes.	4	completeness of the document.
5	O The third column is labeled MP, paren.	5	BY MR. LEN:
б	degree C, closed paren.	6	O Doctor, in your opinion, would a
7	Do you see that?	7	person of ordinary skill in the art be able to
8	A Yes.	8	read Table 1?
9	O What does that stand for?	9	A If he or she had the complete
10	A I assume that's the melting point, but	10	handbook, yes.
11	I'm not sure. Can I review the document?	11	O And you, in fact, have complete
12	O If I can direct your attention,	12	handbooks in your office: is that true?
13	though, back to the cobalt carbonyl line in that	13	A I have the CRC Handbook, for instance.
14	column. Do you see where it states 51 to 52	14	Q Let's try Exhibit 11, which is a
15	DEC? Do you see that?	15	little bit thicker of an exhibit. If I can
16	A Yes.	16	direct your attention to what's labeled in the
17	Q In your understanding, does that mean	17	upper left-hand corner as Page 378 of this
18	that the decomposition temperature is 51 to	18	exhibit.
19	52 degrees C?	19	Do you see where it says Metal
20	A I don't recall this document, so I	20	Carbonyls there?
21	have to review cobalt carbonyl. Could you point	21	A Yes.
22	me to the document where it describes where	22	Q Below that there's Table 8-8,
23	where it defines DEC?	23	properties of metal carbonyls and carbonyl
24	Q Is it your understanding that DEC	24	halides. Do you see that?
25	could mean decompose?	25	A Yes.
	Page 84		Page 85
1	Q At the bottom of the Table 8-8 on	1	and high vapor pressures.
2	Page 378, do you see there is an entry for CO2,	2	Do you see that?
3	open paren, CO, closed paren, 8? Do you see	3	A Yes.
4	that?	4	Q And right below that sentence about
5	A Yes.	5	melting points and boiling points, do you see
6	O Is that the metal carbonyl we have		
		6	the table contains the column for MP degree C
/	been talking about?	6	the table contains the column for MP degree C and BP degree C?
8	been talking about? A Yes.	6 7 8	the table contains the column for MP degree C and BP degree C? A Yes.
7 8 9	been talking about? A Yes. Q Do you see in the second column over	6 7 8 9	the table contains the column for MP degree Cand BP degree C?A Yes.Q With that understanding, does MP mean
8 9 10	been talking about?A Yes.Q Do you see in the second column over there's listed MP degree C? Do you see that?	6 7 8 9 10	the table contains the column for MP degree C and BP degree C?A Yes.Q With that understanding, does MP mean melting point?
7 8 9 10 11	been talking about? A Yes. Q Do you see in the second column over there's listed MP degree C? Do you see that? A Yes.	6 7 8 9 10 11	 the table contains the column for MP degree C and BP degree C? A Yes. Q With that understanding, does MP mean melting point? A Yes.
7 8 9 10 11 12	 been talking about? A Yes. Q Do you see in the second column over there's listed MP degree C? Do you see that? A Yes. Q And then the third column to the right 	6 7 8 9 10 11 12	 the table contains the column for MP degree C and BP degree C? A Yes. Q With that understanding, does MP mean melting point? A Yes. Q And BP means boiling point?
7 8 9 10 11 12 13	 been talking about? A Yes. Q Do you see in the second column over there's listed MP degree C? Do you see that? A Yes. Q And then the third column to the right there's BP degree C. Do you see that? 	6 7 8 9 10 11 12 13	 the table contains the column for MP degree C and BP degree C? A Yes. Q With that understanding, does MP mean melting point? A Yes. Q And BP means boiling point? A Yes.
7 8 9 10 11 12 13 14	 been talking about? A Yes. Q Do you see in the second column over there's listed MP degree C? Do you see that? A Yes. Q And then the third column to the right there's BP degree C. Do you see that? A Yes. A Yes. 	6 7 8 9 10 11 12 13 14	 the table contains the column for MP degree C and BP degree C? A Yes. Q With that understanding, does MP mean melting point? A Yes. Q And BP means boiling point? A Yes. Q So we can direct your attention back
7 8 9 10 11 12 13 14 15	 been talking about? A Yes. Q Do you see in the second column over there's listed MP degree C? Do you see that? A Yes. Q And then the third column to the right there's BP degree C. Do you see that? A Yes. Q Your understanding is MP represents 	6 7 8 9 10 11 12 13 14 15	 the table contains the column for MP degree C and BP degree C? A Yes. Q With that understanding, does MP mean melting point? A Yes. Q And BP means boiling point? A Yes. Q So we can direct your attention back to Page 378, Table 8-8, properties of metal
7 8 9 10 11 12 13 14 15 16	 been talking about? A Yes. Q Do you see in the second column over there's listed MP degree C? Do you see that? A Yes. Q And then the third column to the right there's BP degree C. Do you see that? A Yes. Q Your understanding is MP represents melting point? 	6 7 8 9 10 11 12 13 14 15 16	 the table contains the column for MP degree C and BP degree C? A Yes. Q With that understanding, does MP mean melting point? A Yes. Q And BP means boiling point? A Yes. Q So we can direct your attention back to Page 378, Table 8-8, properties of metal carbonyls and carbonyl halides.
7 8 9 10 11 12 13 14 15 16 17	 been talking about? A Yes. Q Do you see in the second column over there's listed MP degree C? Do you see that? A Yes. Q And then the third column to the right there's BP degree C. Do you see that? A Yes. Q Your understanding is MP represents melting point? A I believe so, but I really yeah, I 	6 7 8 9 10 11 12 13 14 15 16 17	 the table contains the column for MP degree C and BP degree C? A Yes. Q With that understanding, does MP mean melting point? A Yes. Q And BP means boiling point? A Yes. Q So we can direct your attention back to Page 378, Table 8-8, properties of metal carbonyls and carbonyl halides. Direct your attention down to the solution of the properties of the MD
7 8 9 10 11 12 13 14 15 16 17 18	 been talking about? A Yes. Q Do you see in the second column over there's listed MP degree C? Do you see that? A Yes. Q And then the third column to the right there's BP degree C. Do you see that? A Yes. Q Your understanding is MP represents melting point? A I believe so, but I really yeah, I believe so, but Q Loop direct your attention to 	6 7 8 9 10 11 12 13 14 15 16 17 18	 the table contains the column for MP degree C and BP degree C? A Yes. Q With that understanding, does MP mean melting point? A Yes. Q And BP means boiling point? A Yes. Q So we can direct your attention back to Page 378, Table 8-8, properties of metal carbonyls and carbonyl halides. Direct your attention down to the cobalt carbonyl example, you see under the MP
7 8 9 10 11 12 13 14 15 16 17 18 19 20	 been talking about? A Yes. Q Do you see in the second column over there's listed MP degree C? Do you see that? A Yes. Q And then the third column to the right there's BP degree C. Do you see that? A Yes. Q Your understanding is MP represents melting point? A I believe so, but I really yeah, I believe so, but Q I can direct your attention to 	6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	 the table contains the column for MP degree C and BP degree C? A Yes. Q With that understanding, does MP mean melting point? A Yes. Q And BP means boiling point? A Yes. Q So we can direct your attention back to Page 378, Table 8-8, properties of metal carbonyls and carbonyl halides. Direct your attention down to the cobalt carbonyl example, you see under the MP column it's listed as 51 degrees C. Do you see that?
<pre>/ 8 9 10 11 12 13 14 15 16 17 18 19 20 21</pre>	 been talking about? A Yes. Q Do you see in the second column over there's listed MP degree C? Do you see that? A Yes. Q And then the third column to the right there's BP degree C. Do you see that? A Yes. Q Your understanding is MP represents melting point? A I believe so, but I really yeah, I believe so, but Q I can direct your attention to Page 372 of that document. There is a table on Page 372 for metal alkula. Do you see that? 	6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	 the table contains the column for MP degree C and BP degree C? A Yes. Q With that understanding, does MP mean melting point? A Yes. Q And BP means boiling point? A Yes. Q So we can direct your attention back to Page 378, Table 8-8, properties of metal carbonyls and carbonyl halides. Direct your attention down to the cobalt carbonyl example, you see under the MP column it's listed as 51 degrees C. Do you see that?
7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	 been talking about? A Yes. Q Do you see in the second column over there's listed MP degree C? Do you see that? A Yes. Q And then the third column to the right there's BP degree C. Do you see that? A Yes. Q Your understanding is MP represents melting point? A I believe so, but I really yeah, I believe so, but Q I can direct your attention to Page 372 of that document. There is a table on Page 372 for metal alkyls. Do you see that? 	6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	 the table contains the column for MP degree C and BP degree C? A Yes. Q With that understanding, does MP mean melting point? A Yes. Q And BP means boiling point? A Yes. Q So we can direct your attention back to Page 378, Table 8-8, properties of metal carbonyls and carbonyl halides. Direct your attention down to the cobalt carbonyl example, you see under the MP column it's listed as 51 degrees C. Do you see that? A Yes. Q And then under the BP column it's
7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	 been talking about? A Yes. Q Do you see in the second column over there's listed MP degree C? Do you see that? A Yes. Q And then the third column to the right there's BP degree C. Do you see that? A Yes. Q Your understanding is MP represents melting point? A I believe so, but I really yeah, I believe so, but Q I can direct your attention to Page 372 of that document. There is a table on Page 372 for metal alkyls. Do you see that? A Yes. Q In the paragraph above the table, the 	6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	 the table contains the column for MP degree C and BP degree C? A Yes. Q With that understanding, does MP mean melting point? A Yes. Q And BP means boiling point? A Yes. Q So we can direct your attention back to Page 378, Table 8-8, properties of metal carbonyls and carbonyl halides. Direct your attention down to the cobalt carbonyl example, you see under the MP column it's listed as 51 degrees C. Do you see that? A Yes. Q And then under the BP column it's listed as 52 degrees C?
<pre>7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24</pre>	 been talking about? A Yes. Q Do you see in the second column over there's listed MP degree C? Do you see that? A Yes. Q And then the third column to the right there's BP degree C. Do you see that? A Yes. Q Your understanding is MP represents melting point? A I believe so, but I really yeah, I believe so, but Q I can direct your attention to Page 372 of that document. There is a table on Page 372 for metal alkyls. Do you see that? A Yes. Q In the paragraph above the table, the second to last seatence states: In general 	6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24	 the table contains the column for MP degree C and BP degree C? A Yes. Q With that understanding, does MP mean melting point? A Yes. Q And BP means boiling point? A Yes. Q So we can direct your attention back to Page 378, Table 8-8, properties of metal carbonyls and carbonyl halides. Direct your attention down to the cobalt carbonyl example, you see under the MP column it's listed as 51 degrees C. Do you see that? A Yes. Q And then under the BP column it's listed as 52 degrees C?
7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25	 been talking about? A Yes. Q Do you see in the second column over there's listed MP degree C? Do you see that? A Yes. Q And then the third column to the right there's BP degree C. Do you see that? A Yes. Q Your understanding is MP represents melting point? A I believe so, but I really yeah, I believe so, but Q I can direct your attention to Page 372 of that document. There is a table on Page 372 for metal alkyls. Do you see that? A Yes. Q In the paragraph above the table, the second to last sentence states: In general, most alkyls have low melting and boiling points 	6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25	 the table contains the column for MP degree C and BP degree C? A Yes. Q With that understanding, does MP mean melting point? A Yes. Q And BP means boiling point? A Yes. Q So we can direct your attention back to Page 378, Table 8-8, properties of metal carbonyls and carbonyl halides. Direct your attention down to the cobalt carbonyl example, you see under the MP column it's listed as 51 degrees C. Do you see that? A Yes. Q And then under the BP column it's listed as 52 degrees C? A Yes. Q And again under the color inform

22 (Pages 82 to 85)

	Page 86		Page 87
1	column, you see it's orange/crystal?	1	little bit and go back to your declaration
2	A Yes.	2	which, for your reference, is Exhibit Number 2.
3	O So then. Doctor. if we turn your	3	declaration for the '539 patent in support of
4	attention back to Buchanan, back to Column 21,	4	the 662 IPR.
5	Line 24, you see where it states the substrate	5	I want to direct your attention to
б	temperature is about 100 degrees C, 1200	6	Paragraph 137. I'll give you a chance to review
7	degrees C and preferably 200 degrees C to 800	7	that. It's a big paragraph.
8	degrees C?	8	A Yes.
9	A Yes.	9	Q I want to talk a little bit about a
10	Q Both minimums in those temperature	10	person of ordinary skill testing precursors that
11	ranges are above 52 degrees C; is that correct?	11	might be listed in Buchanan.
12	A Yes.	12	If we direct your attention within
13	Q And in your understanding, does that	13	Paragraph 137 on Page 69 of your declaration,
14	mean that that's above the boiling point of	14	midway down that page there's sentence that
15	cobalt carbonyl?	15	starts: Indeed, my experience.
16	A Yes.	16	A Yes.
17	Q And based on the notations in the	17	Q Do you see that?
18	textbooks, is it your understanding that that's	18	It goes on to state: In my
19	above the thermal deposition of cobalt carbonyl?	19	experience, using one of these precursors to
20	A Yes.	20	deposit a film in an ALD reactor, along with
21	Q In fact, the CRC Handbook that you	21	testing to determine the properties of the
22	mentioned earlier uses DEC as an abbreviation	22	deposited film, would generally take no more
23	for decomposition; isn't that true?	23	than one day in a lab equipped with proper ALD
24	A I think so, yes.		equipment.
25	Q Doctor, if we can switch gears a	25	Do you see that?
	Page 88		Page 89
1	A Yes.	1	thickness scales linearly with the dosing
2	Q So I would like to elaborate a little	2	durations for the precursors, that's probably a
3	bit. What is your experience in testing	3	CVD type process with a full thickness, grows
4	precursors?	4	more or less linearly with the growth time.
5	A In my lab, I have three ALD reactors.	5	On the other hand, if it's an ALD
б	And the end application in my case is typically	6	process, above certain dose duration, you would
7	microelectronic devices such as capacitors or	7	find that the thickness did not increase or it
8	transistors.	8	increased marginally. So that would be a quick
9	So when we test precursors for the	9	first test to determine if I'm in the sort of
10	suitability for ALD, for the initial screening	10	the ALD window that we had talked about.
11	if you will, you can run quick experiments where	11	Q You mentioned that you do that test to
12	you choose temperature several temperatures	12	test the suitability of the precursor frailty.
13	in sort of the typical ALD window.		A Right.
14	And then you dose reactants for maybe,		Q Why do you have to test it for
15	you know, half a second cycles and then maybe	15	suitability?
10 17	one-second cycles and then five-second cycles		A Inere's enough there is a lot of
10	times so that herefully you can build up arough		information in this handbook for the other
19	film thickness that can be measured	10	sources that we mentioned. We should give a
20	After you do those depositions we		which precursors might be suitable for ALD
21	measure them using a tool known as an	21	because of the desired attributes that we had
22	ellinsometer for example, which enables you to	22	talked about earlier
23	measure full thicknesses. So then you can	2.3	But of course, you know chemistry is
	and the dense is a fail this lange with the	24	a science and at the end of the day you do
24	correlate the deposited full thickness with the	41	
24 25	dosing durations and you can find out that the	25	want to do experiments to make sure that what a

23 (Pages 86 to 89)

	Page 90		Page 91
1	strong suggestions based on thermal dynamics are	1	synthesize a precursor?
2	borne out in the lab.	2	A Yes.
3	O And that's because the data does not	3	O What does it mean to synthesize a
4	always perfectly correlate to the theory; is	4	precursor?
5	that correct?	5	A So chemists talk about synthesis by
6	A It depends on what you mean by	6	reacting different reagents or molecules so that
7	"perfectly." I mean, that depends on the	7	we end up with a byproduct which is your desired
8	context. But the information that would be	8	molecule.
9	available to a person of ordinary skill would be	9	Q Have you ever synthesized a desired
10	an excellent starting point to choose, you know,	10	molecule?
11	deposition conditions which could be in this ALD	11	A The microelectronics is a highly
12	window, for instance.	12	interdisciplinary field, as I'm sure you know.
13	But then, of course, you do want to do	13	So as an electrical engineer working on
14	experiments to confirm that.	14	microelectronics process technology for 30 plus
15	Q In writing your declaration for this	15	years, I've worked very closely with my
16	process for the in support of the IPRs, did	16	colleagues in chemistry, for instance, and very
17	you test any precursors?	17	often directed them, of course, the synthesis of
18	A Not in the context of writing this.	18	molecules that would be useful to us.
19	But I've been working on ALD since I think 1991.	19	My students and I have worked with
20	We've done a lot of research on ALD of silicon,	20	colleagues in chemistry and, in fact, we
21	germanium and subsequently high-K gate	21	submitted a patent disclosure on the synthesis
22	dielectrics such as hafnium oxide, zirconium	22	of a beryllium precursor molecule.
23	oxide. In that context I have worked with some	23	Unfortunately, the patent got
24	of these dialkylamide precursors.	24	abandoned and ultimately wasn't issued.
25	Q Are you familiar with the term to	25	So in fields such as microelectronics,
	Page 92		Page 93
1		1	
1	you really don't work in shos of electrical		third party yandars, in our assa companies such
2	chemists who don't talk to the physicists. It's	2	as Sigma Aldrich for avampla
4	a very interdisciplinary space	4	Ω And Sigma-Aldrich would be a
5	Ω Just to circle back to your discussion	5	commercial chemical supplier: is that fair to
5	about testing the precursors for suitability for	6	sav?
7	ALD just to be clear not all precursors have	7	A Yes
8	the same ALD window: is that true?	8	O And do commercial chemical suppliers
9	A That's true	9	have standard catalogs or offerings of chemicals
10	O It's part of the reason you need to	10	that they offer?
11	test for it: is that correct?	11	A Yes.
12	A That's correct.	12	O And if a precursor that you wanted to
13	O Now, going back to our discussion of	13	test was not in the commercial supplier's
14	synthesizing precursors, in a hypothetical if	14	standard catalog, how would you go about
15	you're going to perform a test to test a	15	obtaining it?
16	precursor out of Buchanan for its suitability	16	A So in our case, if it's an exotic
17	for ALD, where would you get the precursor?	17	precursor, often what we do is walk over to our
18	A Many of these precursors have been	18	chemistry department and work with them and have
19	known for a long time. So, for instance, this	19	them synthesize the precursors, which as I
20	dialkylamide precursors, which are the subject	20	mentioned a few minutes back I did with my
21	of '016 and '539, I believe they have been known	21	colleague in chemistry who, you know,
22	at least since the 1960s. I recall reviewing a	22	synthesizes beryllium precursors.
23	document by Bradley, for instance, perhaps even	23	We were interested in developing a
24	before that, I don't know.	24	process for building an oxide gate dielectric
25	So in our case when we want to test	25	growth. So that would be one example.

24 (Pages 90 to 93)

	Page 94		Page 95
1	And often what happens is after you	1	Column 6, which I believe we established is a
2	find that a precursor is useful and you publish	2	list of preferred precursors.
3	some papers on that, the commercial vendors will	3	Most of the way down the page in
4	then	4	Column 6, Line 59, I direct your attention to
5	Q Sell it?	5	the first full precursor in Line 59 or the
б	A put them on the catalog.	6	second from the left, which is IR, open paren,
7	Q When you work with your chemist	7	PF, subnote 3, closed paren, sub 4.
8	colleagues, how long does it take them to	8	Do you see that?
9	synthesize a chemical?	9	A Yes.
10	A That would depend on what particular	10	Q Do you know what precursor that is?
11	molecule you're talking about, I guess.	11	A IR I think is iridium, if I remember
12	Q So some can take longer to synthesize	12	right. So the subscript for I don't know
13	than others?	13	exactly, but, I mean, you can look at the
14	A It depends on what you mean by longer.	14	formula and kind of guess.
15	Presumably, yes, I'm sure some reactions are	15	So it would be tetra it's a
16	more complicated than others.	16	compound of phosphorous and fluorine, so I
17	Q I understand. Do you know in your	17	presume phosphofluoride or something, but I
18	experience if any synthesis of chemicals have	18	don't know exactly.
19	taken longer than a day?	19	Q The iridium compound, is that
20	A Offhand, I could not tell you.	20	radioactive?
21	Q Let's go back to the Buchanan exhibit,	21	A I couldn't tell you offhand.
22	Doctor, which should be marked as Banerjee	22	Q Do you know any of the characteristics
∠ 3 2 4	Exhibit Number 9, talk about a couple more	23	or qualities of this precursor?
24	If L can direct your attention to	24	A This particular one, no, not offinand. O Where would you go to find that
20	in real direct your attention to	2.5	Q where would you go to find that
	Page 96		Page 97

Senzaki teaches varying the	1 2 3 4 5 6	Page 109 A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the
1 2 3 4 5 6 7	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition	1 2 3 4 5 6 7	Page 109 A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust
1 2 3 4 5 6 7 8	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct?	1 2 3 4 5 6 7 8	Page 109 A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD.
1 2 3 4 5 6 7 8 9	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct.	1 2 3 4 5 6 7 8 9	Page 109 A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in
1 2 3 4 5 6 7 8 9 10	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the	1 2 3 4 5 6 7 8 9 10	Page 109 A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill,
1 2 3 4 5 6 7 8 9 10 11	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the deposition temperature, in examples in Senzaki,	1 2 3 4 5 6 7 8 9 10 11	Page 109 A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill, they could do that also.
1 2 3 4 5 6 7 8 9 10 11 12	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the deposition temperature, in examples in Senzaki, the deposition rates change; is that also	1 2 3 4 5 6 7 8 9 10 11 12	Page 109 A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill, they could do that also. Q So it would no longer be premixed; is
1 2 3 4 5 6 7 8 9 10 11 12 13	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the deposition temperature, in examples in Senzaki, the deposition rates change; is that also correct?	1 2 3 4 5 6 7 8 9 10 11 12 13	Page 109 A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill, they could do that also. Q So it would no longer be premixed; is that true?
1 2 3 4 5 6 7 8 9 10 11 12 13 14	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the deposition temperature, in examples in Senzaki, the deposition rates change; is that also correct? A The deposition rates in the ALD mode	1 2 3 4 5 6 7 8 9 10 11 12 13 14	Page 109 A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill, they could do that also. Q So it would no longer be premixed; is that true? A Yes.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the deposition temperature, in examples in Senzaki, the deposition rates change; is that also correct? A The deposition rates in the ALD mode would be digital control, but in this particular	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	Page 109 A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill, they could do that also. Q So it would no longer be premixed; is that true? A Yes. Q So if we go back to the first page of
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the deposition temperature, in examples in Senzaki, the deposition rates change; is that also correct? A The deposition rates in the ALD mode would be digital control, but in this particular Example 1, they are changing the silicon to	1 2 3 4 5 6 7 8 9 10 11 2 13 14 15 16	Page 109 A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill, they could do that also. Q So it would no longer be premixed; is that true? A Yes. Q So if we go back to the first page of Senzaki in the abstract, Senzaki discloses a
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the deposition temperature, in examples in Senzaki, the deposition rates change; is that also correct? A The deposition rates in the ALD mode would be digital control, but in this particular Example 1, they are changing the silicon to zirconium alloy composition by changing the	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	Page 109 A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill, they could do that also. Q So it would no longer be premixed; is that true? A Yes. Q So if we go back to the first page of Senzaki in the abstract, Senzaki discloses a process and it lists several steps in the
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the deposition temperature, in examples in Senzaki, the deposition rates change; is that also correct? A The deposition rates in the ALD mode would be digital control, but in this particular Example 1, they are changing the silicon to zirconium alloy composition by changing the deposition temperature because depending on the	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	Page 109 A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill, they could do that also. Q So it would no longer be premixed; is that true? A Yes. Q So if we go back to the first page of Senzaki in the abstract, Senzaki discloses a process and it lists several steps in the process. If you look about at the fourth line
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the deposition temperature, in examples in Senzaki, the deposition rates change; is that also correct? A The deposition rates in the ALD mode would be digital control, but in this particular Example 1, they are changing the silicon to zirconium alloy composition by changing the deposition temperature because depending on the temperature, the relative incorporation of	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill, they could do that also. Q So it would no longer be premixed; is that true? A Yes. Q So if we go back to the first page of Senzaki in the abstract, Senzaki discloses a process and it lists several steps in the process. If you look about at the fourth line down in the abstract of Senzaki, do you see
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the deposition temperature, in examples in Senzaki, the deposition rates change; is that also correct? A The deposition rates in the ALD mode would be digital control, but in this particular Example 1, they are changing the silicon to zirconium alloy composition by changing the deposition temperature because depending on the temperature, the relative incorporation of silicon atoms versus zirconium atoms is being	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 9 20	A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill, they could do that also. Q So it would no longer be premixed; is that true? A Yes. Q So if we go back to the first page of Senzaki in the abstract, Senzaki discloses a process and it lists several steps in the process. If you look about at the fourth line down in the abstract of Senzaki, do you see where it starts with A?
$ \begin{array}{c} 1\\2\\3\\4\\5\\6\\7\\8\\9\\10\\11\\12\\13\\14\\15\\16\\17\\18\\19\\20\\21\end{array} $	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the deposition temperature, in examples in Senzaki, the deposition rates change; is that also correct? A The deposition rates in the ALD mode would be digital control, but in this particular Example 1, they are changing the silicon to zirconium alloy composition by changing the deposition temperature because depending on the temperature, the relative incorporation of silicon atoms versus zirconium atoms is being changed in this particular context.	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 7 18 9 20 21	A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill, they could do that also. Q So it would no longer be premixed; is that true? A Yes. Q So if we go back to the first page of Senzaki in the abstract, Senzaki discloses a process and it lists several steps in the process. If you look about at the fourth line down in the abstract of Senzaki, do you see where it starts with A? A Yes.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the deposition temperature, in examples in Senzaki, the deposition rates change; is that also correct? A The deposition rates in the ALD mode would be digital control, but in this particular Example 1, they are changing the silicon to zirconium alloy composition by changing the deposition temperature because depending on the temperature, the relative incorporation of silicon atoms versus zirconium atoms is being changed in this particular context. O And in the context of the precursors	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill, they could do that also. Q So it would no longer be premixed; is that true? A Yes. Q So if we go back to the first page of Senzaki in the abstract, Senzaki discloses a process and it lists several steps in the process. If you look about at the fourth line down in the abstract of Senzaki, do you see where it starts with A? A Yes. Q It says A is: Providing two or
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the deposition temperature, in examples in Senzaki, the deposition rates change; is that also correct? A The deposition rates in the ALD mode would be digital control, but in this particular Example 1, they are changing the silicon to zirconium alloy composition by changing the deposition temperature because depending on the temperature, the relative incorporation of silicon atoms versus zirconium atoms is being changed in this particular context. Q And in the context of the precursors for Senzaki, the solventless mixtures of	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 9 20 21 22 23	A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill, they could do that also. Q So it would no longer be premixed; is that true? A Yes. Q So if we go back to the first page of Senzaki in the abstract, Senzaki discloses a process and it lists several steps in the process. If you look about at the fourth line down in the abstract of Senzaki, do you see where it starts with A? A Yes. Q It says A is: Providing two or more metal ligand and metalloid ligand complex
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the deposition temperature, in examples in Senzaki, the deposition rates change; is that also correct? A The deposition rates in the ALD mode would be digital control, but in this particular Example 1, they are changing the silicon to zirconium alloy composition by changing the deposition temperature because depending on the temperature, the relative incorporation of silicon atoms versus zirconium atoms is being changed in this particular context. Q And in the context of the precursors for Senzaki, the solventless mixtures of precursors, those are premixed prior to	1 2 3 4 5 6 7 8 9 10 11 22 13 14 15 16 17 18 9 20 21 22 23 24	 Page 109 A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill, they could do that also. Q So it would no longer be premixed; is that true? A Yes. Q So if we go back to the first page of Senzaki in the abstract, Senzaki discloses a process and it lists several steps in the process. If you look about at the fourth line down in the abstract of Senzaki, do you see where it starts with A? A Yes. Q It says A is: Providing two or more metal ligand and metalloid ligand complex precursors, wherein the ligands are preferably
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25	Page 108 zirconium-containing precursor versus the silicon-containing precursor. Q In examples in Senzaki, Senzaki teaches varying the compositional strike that. Senzaki teaches varying the composition by varying the deposition temperature; isn't that correct? A That's correct. Q And as a result of varying the deposition temperature, in examples in Senzaki, the deposition rates change; is that also correct? A The deposition rates in the ALD mode would be digital control, but in this particular Example 1, they are changing the silicon to zirconium alloy composition by changing the deposition temperature because depending on the temperature, the relative incorporation of silicon atoms versus zirconium atoms is being changed in this particular context. Q And in the context of the precursors for Senzaki, the solventless mixtures of precursors, those are premixed prior to deposition; is that true?	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 9 20 21 22 23 24 25	 Page 109 A In Example 1 as shown over here, it is premixed. And they are changing the relative mol fractions by adjusting the temperature, but you could also accomplish different compositions by having a separate source of the zirconium-containing precursor and the silicon-containing precursor and could adjust those flow rates also in ALD. That's not what is described in Example 1, but as a person of ordinary skill, they could do that also. Q So it would no longer be premixed; is that true? A Yes. Q So if we go back to the first page of Senzaki in the abstract, Senzaki discloses a process and it lists several steps in the process. If you look about at the fourth line down in the abstract of Senzaki, do you see where it starts with A? A Yes. Q It says A is: Providing two or more metal ligand and metalloid ligand complex precursors, wherein the ligands are preferably the same.

28 (Pages 106 to 109)

	Page 110		Page 111
1	A Yes	1	your opinion that this precursor in Example 1 on
2	O B, delivering the precursors to the	2	Column 5 of Senzaki can be used in ALD?
3	deposition zone where the substrate is located:	3	A That's correct. You could choose the
4	C, contacting the substrate under deposition	4	deposition temperature, for instance, in the ALD
5	conditions with a precursor; D, varying the	5	window.
6	temperature of deposition from a first	6	Q And so you mentioned the ALD window.
7	temperature to a second distinct temperature	7	If there's two precursors in the mixture of
8	which is at least 40 degrees C from said first	8	Senzaki, which ALD window do you choose?
9	temperature during the contact; and E,	9	A You choose a common window where both
10	depositing a multiple metal and metalloid	10	the silicon-containing precursor and the
11	compound layer on the substrate from the	11	zirconium-containing precursor would fall within
12	precursors resulting in a compositional gradient	12	the window. And what they are doing what you
13	of the metal and metalloid in the layer as a	13	do there is you choose the appropriate
14	result of step D.	14	temperatures where the relative incorporation
15	Do you see that?	15	rates of the zirconium atoms versus the silicon
16	A Yes.	16	atoms could be changed.
17	Q That's a very specific five-step		And this, once again, goes back to the
18	process; is that correct?	18	relative bond strength in this case between the
19	A Yes.	19	zirconium and oxygen and silicon and oxygen.
20	Q And that does not mention the	20	Q Do you know if the ALD windows overlap
21	varying varying the precursors independently		I or those two precursors?
22	that you just talked about earlier; right?	22	A Not officiand, no.
23	A III this case it does not, but one could do that guite assily in my opinion	23	to Column 3 of Sonzoki at the ton
25	Ω So if we go back to Example 1 it's	25	Lines 3 through 7 we start from the
25	Q So if we go back to Example 1, it's	25	Elles 5 through 7, we start from the

A So crystalline titanium nitride is actually an insulator with a band gap of around three to four electron volts. I think I mentioned that in my declaration. However, when you put down those films, they are often not in a single crystal form. So as used in microelectronics, very
1 2 3 4 5 6 7 8 9	A Yes. Q And how is a nitride film different from an oxide film? A Nitride films involve reactions with nitrogen versus oxide films involve reactions to oxygen. In many cases, for microelectronics applications, they belong to the same similar category. They are ceramic materials, they are insulators, which is solid with a so-called	1 2 3 4 5 6 7 8 9	Page 125 periodic table, is titanium nitride a conductor? A So crystalline titanium nitride is actually an insulator with a band gap of around three to four electron volts. I think I mentioned that in my declaration. However, when you put down those films, they are often not in a single crystal form. So as used in microelectronics, very often these are used as ti nitride can be
1 2 3 4 5 6 7 8 9 10	A Yes. Q And how is a nitride film different from an oxide film? A Nitride films involve reactions with nitrogen versus oxide films involve reactions to oxygen. In many cases, for microelectronics applications, they belong to the same similar category. They are ceramic materials, they are insulators, which is solid with a so-called energy band gap.	1 2 3 4 5 6 7 8 9 10	Page 125 periodic table, is titanium nitride a conductor? A So crystalline titanium nitride is actually an insulator with a band gap of around three to four electron volts. I think I mentioned that in my declaration. However, when you put down those films, they are often not in a single crystal form. So as used in microelectronics, very often these are used as ti nitride can be used as a conductor, although the conductor of ti nitride is not going to be as high as that of
1 2 3 4 5 6 7 8 9 10 11	A Yes. Q And how is a nitride film different from an oxide film? A Nitride films involve reactions with nitrogen versus oxide films involve reactions to oxygen. In many cases, for microelectronics applications, they belong to the same similar category. They are ceramic materials, they are insulators, which is solid with a so-called energy band gap. So although nitrides are not the same as oxide a person of ordinary skill would look	1 2 3 4 5 6 7 8 9 10 11	Page 125 periodic table, is titanium nitride a conductor? A So crystalline titanium nitride is actually an insulator with a band gap of around three to four electron volts. I think I mentioned that in my declaration. However, when you put down those films, they are often not in a single crystal form. So as used in microelectronics, very often these are used as ti nitride can be used as a conductor, although the conductor of ti nitride is not going to be as high as that of a metal such as titanium
1 2 3 4 5 6 7 8 9 10 11 12 13	A Yes. Q And how is a nitride film different from an oxide film? A Nitride films involve reactions with nitrogen versus oxide films involve reactions to oxygen. In many cases, for microelectronics applications, they belong to the same similar category. They are ceramic materials, they are insulators, which is solid with a so-called energy band gap. So although nitrides are not the same as oxide, a person of ordinary skill would look to both of those as belonging to the same	1 2 3 4 5 6 7 8 9 10 11 12 13	Page 125 periodic table, is titanium nitride a conductor? A So crystalline titanium nitride is actually an insulator with a band gap of around three to four electron volts. I think I mentioned that in my declaration. However, when you put down those films, they are often not in a single crystal form. So as used in microelectronics, very often these are used as ti nitride can be used as a conductor, although the conductor of ti nitride is not going to be as high as that of a metal such as titanium.
1 2 3 4 5 6 7 8 9 10 11 12 13 14	A Yes. Q And how is a nitride film different from an oxide film? A Nitride films involve reactions with nitrogen versus oxide films involve reactions to oxygen. In many cases, for microelectronics applications, they belong to the same similar category. They are ceramic materials, they are insulators, which is solid with a so-called energy band gap. So although nitrides are not the same as oxide, a person of ordinary skill would look to both of those as belonging to the same belonging to the same class of materials	1 2 3 4 5 6 7 8 9 10 11 12 13 14	Page 125 periodic table, is titanium nitride a conductor? A So crystalline titanium nitride is actually an insulator with a band gap of around three to four electron volts. I think I mentioned that in my declaration. However, when you put down those films, they are often not in a single crystal form. So as used in microelectronics, very often these are used as ti nitride can be used as a conductor, although the conductor of ti nitride is not going to be as high as that of a metal such as titanium. That's why these are sometimes used as barrier layers or local interconnects and things
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15	A Yes. Q And how is a nitride film different from an oxide film? A Nitride films involve reactions with nitrogen versus oxide films involve reactions to oxygen. In many cases, for microelectronics applications, they belong to the same similar category. They are ceramic materials, they are insulators, which is solid with a so-called energy band gap. So although nitrides are not the same as oxide, a person of ordinary skill would look to both of those as belonging to the same belonging to the same class of materials. Q Do you know Doctor are nitrides	1 2 3 4 5 6 7 8 9 10 11 12 13 14	Page 125 periodic table, is titanium nitride a conductor? A So crystalline titanium nitride is actually an insulator with a band gap of around three to four electron volts. I think I mentioned that in my declaration. However, when you put down those films, they are often not in a single crystal form. So as used in microelectronics, very often these are used as ti nitride can be used as a conductor, although the conductor of ti nitride is not going to be as high as that of a metal such as titanium. That's why these are sometimes used as barrier layers or local interconnects and things like that but you cannot use them as long
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	A Yes. Q And how is a nitride film different from an oxide film? A Nitride films involve reactions with nitrogen versus oxide films involve reactions to oxygen. In many cases, for microelectronics applications, they belong to the same similar category. They are ceramic materials, they are insulators, which is solid with a so-called energy band gap. So although nitrides are not the same as oxide, a person of ordinary skill would look to both of those as belonging to the same belonging to the same class of materials. Q Do you know, Doctor, are nitrides conductors?	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16	Page 125 periodic table, is titanium nitride a conductor? A So crystalline titanium nitride is actually an insulator with a band gap of around three to four electron volts. I think I mentioned that in my declaration. However, when you put down those films, they are often not in a single crystal form. So as used in microelectronics, very often these are used as ti nitride can be used as a conductor, although the conductor of ti nitride is not going to be as high as that of a metal such as titanium. That's why these are sometimes used as barrier layers or local interconnects and things like that, but you cannot use them as long distance interconnects such as copper.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	A Yes. Q And how is a nitride film different from an oxide film? A Nitride films involve reactions with nitrogen versus oxide films involve reactions to oxygen. In many cases, for microelectronics applications, they belong to the same similar category. They are ceramic materials, they are insulators, which is solid with a so-called energy band gap. So although nitrides are not the same as oxide, a person of ordinary skill would look to both of those as belonging to the same belonging to the same class of materials. Q Do you know, Doctor, are nitrides conductors? A It depends. So silicon nitride, for	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17	Page 125 periodic table, is titanium nitride a conductor? A So crystalline titanium nitride is actually an insulator with a band gap of around three to four electron volts. I think I mentioned that in my declaration. However, when you put down those films, they are often not in a single crystal form. So as used in microelectronics, very often these are used as ti nitride can be used as a conductor, although the conductor of ti nitride is not going to be as high as that of a metal such as titanium. That's why these are sometimes used as barrier layers or local interconnects and things like that, but you cannot use them as long distance interconnects such as copper.
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	A Yes. Q And how is a nitride film different from an oxide film? A Nitride films involve reactions with nitrogen versus oxide films involve reactions to oxygen. In many cases, for microelectronics applications, they belong to the same similar category. They are ceramic materials, they are insulators, which is solid with a so-called energy band gap. So although nitrides are not the same as oxide, a person of ordinary skill would look to both of those as belonging to the same belonging to the same class of materials. Q Do you know, Doctor, are nitrides conductors? A It depends. So silicon nitride, for example, is an insulator with a lower band gap	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18	Page 125 periodic table, is titanium nitride a conductor? A So crystalline titanium nitride is actually an insulator with a band gap of around three to four electron volts. I think I mentioned that in my declaration. However, when you put down those films, they are often not in a single crystal form. So as used in microelectronics, very often these are used as ti nitride can be used as a conductor, although the conductor of ti nitride is not going to be as high as that of a metal such as titanium. That's why these are sometimes used as barrier layers or local interconnects and things like that, but you cannot use them as long distance interconnects such as copper. Q Doctor, isn't it true the Min does not disclose the use of precursors source mixtures?
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	A Yes. Q And how is a nitride film different from an oxide film? A Nitride films involve reactions with nitrogen versus oxide films involve reactions to oxygen. In many cases, for microelectronics applications, they belong to the same similar category. They are ceramic materials, they are insulators, which is solid with a so-called energy band gap. So although nitrides are not the same as oxide, a person of ordinary skill would look to both of those as belonging to the same belonging to the same class of materials. Q Do you know, Doctor, are nitrides conductors? A It depends. So silicon nitride, for example, is an insulator with a lower band gap than silicon dioxide. And these strengths can	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19	Page 125 periodic table, is titanium nitride a conductor? A So crystalline titanium nitride is actually an insulator with a band gap of around three to four electron volts. I think I mentioned that in my declaration. However, when you put down those films, they are often not in a single crystal form. So as used in microelectronics, very often these are used as ti nitride can be used as a conductor, although the conductor of ti nitride is not going to be as high as that of a metal such as titanium. That's why these are sometimes used as barrier layers or local interconnects and things like that, but you cannot use them as long distance interconnects such as copper. Q Doctor, isn't it true the Min does not disclose the use of precursors source mixtures? A I guess it's talking about using TMAT
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	A Yes. Q And how is a nitride film different from an oxide film? A Nitride films involve reactions with nitrogen versus oxide films involve reactions to oxygen. In many cases, for microelectronics applications, they belong to the same similar category. They are ceramic materials, they are insulators, which is solid with a so-called energy band gap. So although nitrides are not the same as oxide, a person of ordinary skill would look to both of those as belonging to the same belonging to the same class of materials. Q Do you know, Doctor, are nitrides conductors? A It depends. So silicon nitride, for example, is an insulator with a lower band gap than silicon dioxide. And these strengths can be understood broad trends can be understood	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20	Page 125 periodic table, is titanium nitride a conductor? A So crystalline titanium nitride is actually an insulator with a band gap of around three to four electron volts. I think I mentioned that in my declaration. However, when you put down those films, they are often not in a single crystal form. So as used in microelectronics, very often these are used as ti nitride can be used as a conductor, although the conductor of ti nitride is not going to be as high as that of a metal such as titanium. That's why these are sometimes used as barrier layers or local interconnects and things like that, but you cannot use them as long distance interconnects such as copper. Q Doctor, isn't it true the Min does not disclose the use of precursors source mixtures? A I guess it's talking about using TMAT in this particular case. Are you asking what if
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	A Yes. Q And how is a nitride film different from an oxide film? A Nitride films involve reactions with nitrogen versus oxide films involve reactions to oxygen. In many cases, for microelectronics applications, they belong to the same similar category. They are ceramic materials, they are insulators, which is solid with a so-called energy band gap. So although nitrides are not the same as oxide, a person of ordinary skill would look to both of those as belonging to the same belonging to the same class of materials. Q Do you know, Doctor, are nitrides conductors? A It depends. So silicon nitride, for example, is an insulator with a lower band gap than silicon dioxide. And these strengths can be understood broad trends can be understood based on the periodic table.	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21	Page 125 periodic table, is titanium nitride a conductor? A So crystalline titanium nitride is actually an insulator with a band gap of around three to four electron volts. I think I mentioned that in my declaration. However, when you put down those films, they are often not in a single crystal form. So as used in microelectronics, very often these are used as ti nitride can be used as a conductor, although the conductor of ti nitride is not going to be as high as that of a metal such as titanium. That's why these are sometimes used as barrier layers or local interconnects and things like that, but you cannot use them as long distance interconnects such as copper. Q Doctor, isn't it true the Min does not disclose the use of precursors source mixtures? A I guess it's talking about using TMAT in this particular case. Are you asking what if TMAT is mixed with another reactant or
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	A Yes. Q And how is a nitride film different from an oxide film? A Nitride films involve reactions with nitrogen versus oxide films involve reactions to oxygen. In many cases, for microelectronics applications, they belong to the same similar category. They are ceramic materials, they are insulators, which is solid with a so-called energy band gap. So although nitrides are not the same as oxide, a person of ordinary skill would look to both of those as belonging to the same belonging to the same class of materials. Q Do you know, Doctor, are nitrides conductors? A It depends. So silicon nitride, for example, is an insulator with a lower band gap than silicon dioxide. And these strengths can be understood broad trends can be understood based on the periodic table. Q And based sorry, are you finished?	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22	Page 125 periodic table, is titanium nitride a conductor? A So crystalline titanium nitride is actually an insulator with a band gap of around three to four electron volts. I think I mentioned that in my declaration. However, when you put down those films, they are often not in a single crystal form. So as used in microelectronics, very often these are used as ti nitride can be used as a conductor, although the conductor of ti nitride is not going to be as high as that of a metal such as titanium. That's why these are sometimes used as barrier layers or local interconnects and things like that, but you cannot use them as long distance interconnects such as copper. Q Doctor, isn't it true the Min does not disclose the use of precursors source mixtures? A I guess it's talking about using TMAT in this particular case. Are you asking what if TMAT is mixed with another reactant or Q The last reference we just spoke
1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	A Yes. Q And how is a nitride film different from an oxide film? A Nitride films involve reactions with nitrogen versus oxide films involve reactions to oxygen. In many cases, for microelectronics applications, they belong to the same similar category. They are ceramic materials, they are insulators, which is solid with a so-called energy band gap. So although nitrides are not the same as oxide, a person of ordinary skill would look to both of those as belonging to the same belonging to the same class of materials. Q Do you know, Doctor, are nitrides conductors? A It depends. So silicon nitride, for example, is an insulator with a lower band gap than silicon dioxide. And these strengths can be understood broad trends can be understood based on the periodic table. Q And based sorry, are you finished? A What was the question again?	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23	Page 125 periodic table, is titanium nitride a conductor? Q Based on your earlier discussions today, you agree if you're outside of the ALD window for Min, the process would change to a CVD process; correct? MR. LANG: Objection to form. THE WITNESS: If you're higher than this temperature window? BY MR. LEN: Q Yes. A You get decomposition of the TMAT as shown over here. But if that's all that you flow in without ammonia, you do not get CVD of ti nitride. You get a film of titanium presumably. Q The film of titanium would be due to a CVD process; correct?	1 2 3 4 5 6 7 8 9 10 11 12 13 14 15 16 17 18 19 20 21 22 23 24 25	Page 129 MR. LANG: Objection to form. Greg, you agree that form covers asked and answered? MR. LEN: Yes. THE WITNESS: So above 210 degrees, if the TMAT decomposed, it would be a decomposition. BY MR. LEN: Q In fact, if we look back at your Paragraph 106 of Exhibit 6, states the third sentence down states: In contrast, Min noted that above 230 degrees C, ALD was not taking place but, rather, CVD was taking place because film thickness per cycle above 230 degrees C gradually increased as a function of temperature. Do you see that? A Yes. Q So you agree that above the temperature window, CVD can take place? A Yes. Q You mentioned that the titanium nitride might not be deposited above a certain temperature. A I stated that if you just flow in the

33 (Pages 126 to 129)

	Page 130		Page 131
1	TMAT without the ammonia, if you commingle the	1	turns out.
2	two, then you could get ti nit.	2	MR. LEN: Okay, Jason, I think we're
3	O Would you agree that impurities can	3	at the end of our questions for now. We'll
4	impact the dielectric properties of a film?	4	pass the witness to you.
5	A It depends on what kinds of impurities	5	MR. LANG: Yes. I have a couple of
б	you're talking about. Some could, some may not.	6	auestions.
7	Q And would you agree that impurities	7	EXAMINATION
8	could also be referenced to as contamination of	8	BY MR. LANG:
9	the film?	9	Q Good afternoon, Dr. Banerjee.
10	A Some people do.	10	A Good afternoon.
11	Q Okay. And in that context when people	11	Q Are you familiar with this kind of
12	are referring to contamination of the film, you	12	the comical scene where some wizard from
13	would want to avoid that to maintain the	13	500 years ago is just throwing everything in a
14	dielectric properties of them; is that correct?	14	black pot and a magic potion comes out?
15	A Yes. The contaminants have a	15	A Yes.
16	deleterious effect on the properties. You would	16	Q Sometimes referred to as alchemy?
17	want to avoid.	17	A Yes.
18	Q In fact, carbon can be a contaminant	18	Q In the late '90s, is that what people
19	with deleterious effect; is that true?	19	were doing with picking precursors?
20	A It can have bad effects on dielectrics	20	MR. LEN: Object to form.
21	in some cases, yes.	21	THE WITNESS: Not at all, no.
22	Q Also can nitrogen have bad effects on	22	BY MR. LANG:
23	dielectrics?	23	Q And what were some of the initial
24	A In some cases, yes, but in some cases	24	steps folks took when they were looking at
25	nitrogen can also have beneficial effects, it	25	precursors to use?
	Page 132		Page 133
1	A As I mentioned during my earlier	1	BY MR. LANG:
2	testimony, this there is an enormous body of	2	O And we talked about the Min reference?
3	knowledge in terms of the thermodynamic	3	À Yes.
4	properties of these chemicals as far as other	4	Q Is the Min reference an example that
5	things. So you would want to look to that, for	5	might inform your view on what precursor would
б	instance.	6	be successful?
7	Q Dr. Banerjee, did that type of	7	MR. LEN: Same objection.
8	information exist in the late 1990s?	8	THE WITNESS: Yes.
9	A Yes.	9	BY MR. LANG:
10	Q And I think you referred to, in fact,	10	Q What does Min what would strike
11	one of these handbooks that had some of that	11	that.
12	information?	12	One of ordinary skill reading Min in
13	A Yes.	13	the late 1990s, what would that inform that
14	Q And do you keep that handbook in your	14	person in regards to the ALD window in metal
15	office?	15	dicyclomine?
16	A I have it on my desk. I have had it	16	MR. LEN: Objection.
17	for probably 30 years. It's a CRC Handbook of	17	THE WITNESS: I looked at Figure 3,
18	Physics and Chemistry.		tor example, of Min, and as I guess the
19	Q In addition to these handbooks, are	19	graph labeled A indicates, there is a flat
20	there examples that you can look to, for	20	portion of the curve between 170 degrees and
21	example, examples of ALD that might have been		210 degrees where the film thickness per
22	performed that would inform your view on		cycle is independent of temperature. And
23	precursors?		that's symptomatic of ALD.
∠4 2⊑	MIK. LANU: UDJECTION TO FORM.		So there would be a strong strong
<u>45</u>	THE WITNESS: Yes.	25	evidence to a person of ordinary skill that

34 (Pages 130 to 133)

	Page 134		Page 135
1	you can achieve ALD of ti nitride using TMAT	1	BY MR. LANG:
2	in this case. But it goes beyond that.	2	O And you testified earlier about the
3	If, instead of ti nitride, one was	3	notion of contaminants ending up in a film?
4	interested in deposition of dielectrics such	4	A Yes.
5	as hafnium oxide or zirconium oxide, from	5	Q And if a process produces
6	knowledge of basic chemistry that titanium	6	contaminants, does that mean that no matter what
7	lies in the same column of the periodic	7	you do with those precursors, you're always
8	table as zirconium and hafnium, that would	8	going to get contaminants?
9	tell someone that the chemical properties of	9	MR. LEN: Objection.
10	titanium, hafnium, zirconium are probably	10	THE WITNESS: Not at all. What it
11	going to be quite similar.	11	means is I've probably not chosen my
12	And then when it comes to nitride	12	deposition parameters appropriately, where
13	versus oxides although it's true that	13	if I'm worried about carbon contamination, I
14	they are not identical as I was	14	may want to choose different deposition
15	describing to counsel a few minutes back,	15	conditions where these methyl or ethyl
16	they sort of belong to the same category of	16	groups, ligands, are removed in a so-called
17	materials in the context of	17	facile mode and they don't end up leading to
18	microelectronics.	18	contamination in the field.
19	So the point I'm trying to make is the	19	BY MR. LANG:
20	teaching of Min vis-a-vis ti nitride would	20	Q Thank you, Dr. Banerjee. Can you turn
21	inform a person of ordinary skill that it	21	to Senzaki, which is Exhibit 12.
22	could smartly choose precursors for the	22	A Yes.
23	deposition of zirconium oxide or hafnium	23	Q And I would like to turn your
24	oxide.	24	attention to Column 3, I believe it's Line 40
25		25	maybe, starting with "Surprisingly."
	Page 136		Page 137
1	A Okay.	1	inform your view on what this precursor for
2	Q And it talks about the invention and	2	Example 1 can be applied to?
3	it references a zirconium precursor, I believe.	3	MR. LEN: Objection, form.
4	A Yes.		THE WITNESS: As I've told counsel
5	Q And then immediately following that,	5	before, ALD is a subset of CVD, so a lot of
6	if you turn your attention to Column 4, and it	6	CVD precursors are applicable to ALD with
7	states at Line 4, "In addition to thermal low		appropriate optimization of the deposition
8	pressure CVD, the above precursors could be used	8	conditions.
9	for, and then it continues and states that it	10	BY MR. LANG:
10	could be used for atomic layer deposition.		Q And this precursor is referring to
10	A Yes.		
12	Q Okay. what does that when it says		A I.e.s. O Is that the same as one of these
14	the above precursors, what is that above		Q Is that the same as one of these
15	A Wall in this examplem, asso it will	15	A That's correct
16	A well, in this exemptary case, it will be the ziroonium othul tetralia it's ZD	16	A find is Column 4 we have that that
17	or the zhoumuni, ethyl, telläkis il S ZK,	17	evact precursor can be used for AI D?
1.8	subscript 2 parantheses subscript 4	18	Δ That's correct
19	So that's one of the precursors and \mathbf{S}_{0}	19	MR I FN. Objection
20	the other one is a similar silicon containing		MR I ANG: That's all I have
20	nrecursor So one would read Column 4 the ALD	21	MR LEN. I have two redirects
22	deposition referring to similar precursors like	2.2	FURTHER EXAMINATION
23	this	23	BY MR. LEN:
2.5	uns.	1	
2.4	O Okay And then we take that context	24	O So. Doctor, just talking about this
24 25	Q Okay. And then we take that context and look at Example 1 on Column 5. does that	24 25	Q So, Doctor, just talking about this Senzaki reference, which is Exhibit 12, I think

35 (Pages 134 to 137)

	Page 138		Page 139
1	you still have it in front of you	1	their fluorine, oxygen and nitrogen substituted
2			analogs
3	0 And specifically counsel just asked	3	Do you see that?
4	you about Columns 3 and Column 4. Do you	4	Λ Ves
5	romember that?	5	A Its. O How many additional productor mixtures
5		6	does that disclose?
0 7	A 105. And Column 2 directed your attention		A I didn't count I guess shout a dezen
7 Q	to approximately Line 40, there is a zirconium		A Tuldit t count. T guess about a dozen
0	to approximately Line 40, mere is a zircomum	0	O So it's not just the one zireonium
10	A Voc	10	Q So it's not just the one zircomum
11	A ICS.		A Dight So the giroonium progumer we
10	Q Isin the true that below that starting		A Right. So the zircontum precursor we talked about configure is just on examplemy cose
12	around Column 5, Line 54, additional precursors		Depending on the englished an exemplary case.
14	are also listed? Is that true?	14	Depending on the application, as you point out,
14	A Yes.		there could be other choices also.
15	Q And in fact, it states that in	15	Q And do you know if all of those
10	preferred mode, the mixture of two or more metal		permutations of precursors listed in Column 3
1/	ligand and metalloid ligand complex precursors,		from Line 54 through 62, if all of those work
18	which preferably constitute a liquid at ambient		for ALD?
19	temperatures I apologize, it says: At	19	MR. LANG: Objection to form.
20	ambient conditions and ligands, which can be the	20	THE WITNESS: I mean, a priori, I may
21	same or different, and are selected group	21	or may not know that. But as I told you
22	consisting of alkyls, alkoxides, halides,	22	before, if one is interested in doing ALD,
23	hydrides, amides, imides, azides, nitrates,	23	what I do is I look to these handbooks or
24	cyclopentadienyls, carbonyls, beta diketonates,	24	the Internet and I look up the basic
25	beta ketoiminates, beta diminates, pyrazoles and	25	properties of some of these and that would
