## (12) United States Patent Ellis et al.

## (54) INTERACTIVE TELEVISION PROGRAM GUIDE WITH REMOTE ACCESS

(75) Inventors: Michael D. Ellis, Boulder, CO (US);
William L. Thomas, Bixby, OK (US);
Joel G. Hassell, Arvada, CO (US);
Thomas R. Lemmons, Sand Springs,
OK (US); David M. Berezowski, Tulsa,
OK (US); Robert A. Knee, Lansdale, PA
(US); Robert H. McCoy, Broken Arrow,
OK (US)

(73) Assignee: United Video Properties, Inc., Tulsa, OK (US)

(\*) Notice: Subject to any disclaimer, the term of this patent is extended or adjusted under 35 U.S.C. 154(b) by 735 days.

(21) Appl. No.: 11/820,587

(22) Filed: Jun. 19, 2007

(65) Prior Publication Data

US 2008/0010655 A1 Jan. 10, 2008

## Related U.S. Application Data

- (63) Continuation of application No. 11/246,392, filed on Oct. 7, 2005, which is a continuation of application No. 10/927,814, filed on Aug. 26, 2004, which is a continuation of application No. 09/354,344, filed on Jul. 16, 1999, now abandoned.
- (60) Provisional application No. 60/097,527, filed on Aug. 21, 1998, provisional application No. 60/093,292, filed on Jul. 17, 1998.
- (51) Int. Cl. H04N 5/445 (2006.01) H04N 7/173 (2006.01) H04N 1/16 (2006.01)

(10) Patent No.: US 7,913,278 B2 (45) Date of Patent: Mar. 22, 2011

### (57) ABSTRACT

An interactive television program guide with remote access is provided. The interactive television program guide is implemented on interactive television program guide equipment. A remote program guide access device is connected to the interactive television program guide equipment by a remote access link to provide a user with remote access to program guide functions.

#### INTERACTIVE TELEVISION PROGRAM GUIDE WITH REMOTE ACCESS

# CROSS REFERENCE TO RELATED APPLICATIONS

This application is a continuation of U.S. patent application Ser. No. 11/246,392, filed Oct. 7, 2005, which is a continuation of U.S. patent application Ser. No. 10/927,814, filed Aug. 26, 2004, which is a continuation of U.S. patent application Ser. No. 09/354,344, filed Jul. 16, 1999, now abandoned which claims the benefit of U.S. Provisional Application No. 60/097,527, filed Aug. 21, 1998 and U.S. Provisional Application No. 60/093,292, filed Jul. 17, 1998, all of which are hereby incorporated by reference herein in their entireties. 15

#### BACKGROUND OF THE INVENTION

This invention relates to interactive television program guide video systems, and more particularly, to interactive 20 television program guide systems that provide remote access to program guide functionality.

Cable, satellite, and broadcast television systems provide viewers with a large number of television channels. Users have traditionally consulted printed television program 25 schedules to determine the programs being broadcast at a particular time. More recently, interactive electronic television program guides have been developed that allow television program information to be displayed on a user's television.

Interactive television program guides allow the user to navigate through television program listings using a remote control. In a typical program guide, various groups of television program listings are displayed in predefined or user-defined categories. Listings are typically displayed in a grid 35 or table.

Interactive television program guides are typically implemented on set-top boxes located in the homes of users. A typical set-top box is connected to the user's television and videocassette recorder. The program guide system is therefore not portable. As a result, the user cannot use the program guide to adjust program reminder settings, to select programs for recording, to purchase pay-per-view programs, or to perform other program guide functions without that user being physically located in the same room in the home.

On-line program guides allow users to view program listings using a web-browser. However, the on-line program guides that are available on the Internet do not provide the versatility of in-home program guides. For example, on-line program guides do not allow the user to set in-home reminders for programming, to adjust parental control settings, or to select programs for recording on the user's videocassette recorder.

On-line program guides have also been implemented that allow users to order pay-per-view programs. Such systems 55 allow users to order programs via a web server as opposed to via the telephone or using impulse ordering. A third party takes orders via the internet, bills the user, and provides ordering information to the headend. The headend authorizes the user's set-top to view the ordered program using conventional signal denial or signal scrambling systems without coordinating the ordering of the pay-per-view program with an in-home guide. Ordering pay-per-view programs in this manner (i.e., without coordinating the order with an in-home guide), does not provide users with many of the benefits of ordering pay-per-views through an in-home guide, such as upcoming program reminders or missed program reminders.

2

Users are also not prevented from attempting to order a payper-view program with a guide after the program has been ordered

Program guides that run on personal computers are also available. Such programs guides are useful for users who wish to view program listings information, but who cannot readily access their set-top-box-based program guide. For example, another member of the user's household may be watching television and therefore dominating the use of the set-top box and television. Because there is no way for the user of such a personal computer program guide to coordinate the operation of the personal computer program guide, the user of a personal computer program guide is not able to use the personal computer program guide to set in-home reminders for programming, to adjust parental control settings, to select programs for recording on the user's videocassette recorder, or to purchase pay-per-view programs.

Presently existing program guide systems therefore require that the user be physically present in the home to access important program guide features such as program reminders, parental control, and program recording.

It is therefore an object of the present invention to provide an interactive televison program guide system in which the program guide may be remotely accessed by the user. Such a system may allow the user to access important features of the user's in-home program guide from a remote location and set program guide settings for those features.

#### SUMMARY OF THE INVENTION

This and other objects of the present invention are accomplished in accordance with the principles of the present invention by providing an interactive television program guide system with remote access. A local interactive television program guide is implemented on interactive television program guide equipment. The interactive television program guide equipment is connected to one or more remote program guide access devices over a remote access link. A remote access interactive television program guide is implemented on the remote program guide access device. The remote program guide and remote program guide access devices provide users with the opportunity to remotely access features of the interactive television program guide on the interactive television program guide on the interactive television program guide settings.

Any suitable interactive television program guide function or setting may be accessed. The remote access program guide may, for example, provide the user with an opportunity to remotely schedule a reminder for a program, remotely view television program listings, remotely select programming for recordings (storage), remotely play a stored program or a currently broadcasted program on the remote program guide access device, remotely set and navigate through favorites (e.g., favorite channels, program categories, services, etc.), and remotely set parental control settings.

The remote program guide access device may also provide the user with an opportunity to remotely perform additional functions such as sending and playing or displaying messages with the interactive television program guide, polling the interactive program guide for status information, and storing interactive television program guide data at the remote program guide access device.

Providing remote access to these and other features may allow users to control television related activity in ways and in situations in which the users could not do so before. A person who is caught in traffic in an automobile may, for example,

access the program guide using appropriate voice commands to access listings for programs that the user anticipates he or she will not arrive home in time to view. The listings may be displayed on a screen, or recited back to the user in synthesized voice listings. The user may select any such programs 5 for recording on their videocassette recorder or other storage device in the home, or on a server at a television distribution facility or other distribution facility. Systems in which users store programs on a remote server are described, for example, in Ellis et al. U.S. patent application Ser. No. 09/332,244, 10 filed Jun. 11, 1999, which is hereby incorporated by reference herein in its entirety.

A parent may, for example, access the program guide while at work to see if a child is watching television. If the child should not be watching television, the parent may cause the 15 program guide to display a message to the child (e.g., "Go do your homework!") and then may prevent viewing via a parental control feature. On the other hand, if television viewing is prevented by default (e.g., prevented until the parent arrives home), then the parent may remotely access the program 20 display by a remote access device in accordance with the guide to allow a child to watch television.

A person at work may, for example, receive a call from a spouse or other family member at home who explains to the person at work that the person at home cannot operate home television equipment as desired (e.g., "I can't program the 25 VCR!"). The person at work may remotely access the program guide, poll for equipment status information, and perform the desired function.

If desired, non-program-guide applications may be implemented on the user television equipment. Such non-program- 30 guide applications may include, for example, a web browser application, a home shopping application, a game application, an e-mail application, a chat application, a banking application, etc. These applications may be implemented on a set-top box within the user television equipment. The user 35 may adjust the settings of such a non-program-guide application using a remote access device.

Further features of the invention, its nature and various advantages will be more apparent from the accompanying drawings and the following detailed description of the pre- 40 ferred embodiments.

#### BRIEF DESCRIPTION OF THE DRAWINGS

FIG. 1 is a schematic block diagram of an illustrative 45 system in accordance with the present invention.

FIGS. 2a-2d show illustrative arrangements for the interactive television program guide equipment and remote program guide access device of FIG. 1 in accordance with the principles of the present invention.

FIG. 3 is an illustrative schematic block diagram of the user television equipment of FIG. 2 in accordance with the principles of the present invention.

FIG. 4 is a generalized schematic block diagram of poraccordance with the principles of the present invention.

FIG. 5 is a schematic block diagram of an illustrative remote program guide access device in accordance with the principles of the present invention.

FIGS. 6a, 6b, and 6c are schematic block diagrams of 60 illustrative arrangements for supporting communications between a remote program guide access device and interactive television program guide equipment over an Internet link in accordance with the principles of the present invention.

FIGS. 7 and 8 are illustrative remote program guide access 65 device display screens in accordance with the principles of the present invention.

FIG. 9 is an illustrative program reminder for display by interactive television program guide equipment or a remote program guide access device in accordance with the principles of the present invention.

FIG. 10 is an illustrative favorites screen for display by a remote program guide access device in accordance with the principles of the present invention.

FIG. 11 is an illustrative status display screen for display by a remote program guide access device in accordance with the principles of the present invention.

FIGS. 12-23 are illustrative flow charts of steps involved in providing remote access to interactive television program guide features in accordance with the principles of the present

FIG. 24 is an illustrative Internet browser screen for display by a remote access device in accordance with the principles of the present invention.

FIG. 25 is an illustrative shopping data entry screen for principles of the present invention.

FIG. 26 is an illustrative stock ticker data entry screen for display by a remote access device in accordance with the principles of the present invention.

#### DETAILED DESCRIPTION OF THE PREFERRED **EMBODIMENTS**

An illustrative system 10 in accordance with the present invention is shown in FIG. 1. Main facility 12 provides interactive television program guide data from program guide data source 14 to interactive television program guide equipment 17 via communications link 18. There are preferably numerous pieces or installations of interactive television program guide equipment 17, although only one is shown in FIG. 1 to avoid over-complicating the drawing. Link 18 may be a satellite link, a telephone network link, a cable or fiber optic link, a microwave link, a combination of such links, an Internet link, or any other suitable communications path.

The interactive television program guide data transmitted by main facility 12 to interactive television program guide equipment 17 may include television program listings data (e.g., program times, channels, titles, and descriptions) and other program guide data for additional services other than television program listings (e.g., pay-per-view information, weather information, associated Internet web links, computer software, etc.). Interactive television program guide equipment 17 may be connected to remote program guide access device 24 via remote access link 19. Interactive television program guide equipment may have more than one associated remote program guide access device 24, although only one such device 24 is shown in FIG. 1 to avoid overcomplicating

An interactive television program guide is implemented on tions of the illustrative television equipment of FIG. 3 in 55 interactive television program guide equipment 17. Four illustrative arrangements for interactive television program guide equipment 17 is shown in FIGS. 2a-2d. As shown in FIGS. 2a-2d interactive television program guide equipment 17 may include program guide distribution equipment 21 located at television distribution facility 16 and user television equipment 22. Television distribution facility 16 may be any suitable distribution facility (e.g., a cable system headend, a broadcast distribution facility, a satellite television distribution facility, or any other suitable type of television distribution facility). Television distribution facility 16 may distribute program guide data that it received from main facility 12 to multiple users via communications path 20.

Program guide distribution equipment 21 may be any equipment suitable for providing program guide data to user television equipment 22. Program guide distribution equipment 21 may include, for example, suitable transmission hardware for distributing program guide data on a television 5 channel sideband, in the vertical blanking interval of a television channel, using an in-band digital channel, using an out-of-band digital signal, or by any other suitable data transmission technique. Video signals (e.g., television programming) may also be provided by program guide distribution 10 equipment 21 to user television equipment 22 over communications paths 20 on multiple television channels.

FIGS. 2a and 2b show illustrative arrangements for interactive television program guide equipment 17 and remote program guide access device 24 in systems in which program 15 guide data is provided to user television equipment 22 using a non client-server based approach. For example, program guide data may be provided by television distribution facility 16 to user television equipment 22 in a continuous stream or may be transmitted at a suitable time interval (e.g., once per 20 hour). If transmitted continuously, it may not be necessary to store data locally at user television equipment 22. Rather, user television equipment 22 may extract data "on the fly" as it is needed. If desired, television distribution facility 16 may poll user television equipment 22 periodically for certain infor- 25 mation (e.g., pay program account information or information regarding programs that have been purchased and viewed using locally-generated authorization techniques).

In the system configuration of FIG. 2a, remote program guide access device 24 is connected to user television equip- 30 ment 22. Television distribution facility 16 may distribute program guide data to user television equipment 22. User television equipment 22 may transfer the program guide data to remote program guide access device 24. User television equipment 22 may also transfer additional data that may be 35 necessary for allowing remote program guide access device 24 to access various functions of the interactive program guide (e.g., reminder information, parental control settings, favorite channel settings, user profiles, etc.). Any suitable distribution scheme may be used. For example, user televi- 40 sion equipment 22 may provide the data to remote program guide access device 24 continuously, periodically, using a client-server based approach, using a polling scheme, or using any other suitable approach. Remote program guide access device 24 may store the data if suitable for a particular 45 transmission scheme.

In the system configuration of FIG. 2b, remote program guide access device 24 is connected to television distribution facility 16 via communications device 27. In this approach television distribution facility 16 may distribute program 50 guide data to remote program guide access device 24 directly. Television distribution facility 16 may also distribute additional data from user television equipment 22 that may be necessary for allowing remote program guide access device 24 to access various functions of the interactive program 55 guide (e.g., reminder information, parental control settings, favorite channel settings, user profiles, etc.). Television distribution facility 16 may provide the data to remote program guide access device 24 continuously, periodically, using a client-server based approach, using a polling scheme, or 60 using any other suitable approach. Remote program guide access device may store the data if suitable for a particular transmission scheme.

FIGS. 2c and 2d show illustrative arrangements for interactive television program guide equipment 17 and remote 65 program guide access device 24 in client-server based interactive program guide systems. As shown in FIGS. 2c and 2d,

6

program guide distribution equipment 21 may include program guide server 25. Program guide server 25 may be any suitable software, hardware, or combination thereof for providing a client-server based program guide. Program guide server 25 may, for example, generate program guide display screens as digital frames and distribute the frames to user television equipment 22 for display by an interactive program guide client implemented on user television equipment 22. In another suitable approach, program guide server 25 may run a suitable database engine, such a SQL server, and provide program guide data in response to queries generated by user television equipment 22. If desired, program guide server 25 may be located at main facility 12 or at some other facility suitable for providing program guide data via a program guide server (not shown).

Remote program guide access device 24 may, for example, communicate with user television equipment 22 over remote access link 19 as shown in FIG. 2c. Requests, commands, or other suitable communications may be provided by remote program guide access device 24 to user television equipment 22 and then forwarded by user television equipment 22 to program guide server 25. Program guide data or display screens provided by program guide server 25 may be forwarded by user television equipment 22 to remote program guide access device 24.

Alternatively, remote program guide access device 24 may, for example, communicate with program guide server 25 over remote access link 19 via communications device 27 as shown in FIG. 2d. Appropriate commands, requests, or other suitable communications may be transmitted by remote program guide access device 24 for processing by program guide server 25. If any changes to program guide settings are made (e.g., a change to the parental control settings), program guide server may, for example, update a local program guide client running on user television equipment 22 with the necessary information.

In the arrangements illustrated in FIGS. 2b and 2d, television distribution facility 16 may have communications device 27 for communicating with remote program guide access device 24 over remote access link 19. Communications device 27 may be, for example, a communications port (e.g., a serial port, parallel port, universal serial bus (USB) port, etc.), modem (e.g., any suitable analog or digital modem, cellular modem, or cable modem), network interface card (e.g., an Ethernet card, token ring card, etc.), wireless transceiver (e.g., an infrared transceiver or other suitable transceiver), or other suitable communications device.

As shown in FIGS. 1 and 2a-2d, interactive television program guide equipment 17 communicates with remote program guide access device 24 via remote access link 19. In practice, remote program guide access device 24 may be connected to user television equipment 22 (as shown in FIGS. 2a and 2c), television distribution facility 16 (as shown in FIG. 2b), connected to both (as indicated in FIG. 1), or may communicate with remote program guide server 25 (as shown in FIG. 2d) via remote access link 19. Remote access link 19 may be any suitable wired or wireless communications path or paths over which digital or analog communications may take place between interactive television program guide equipment 17 and remote program guide access device 24.

Each user has user television equipment 22 for displaying the television program listings information and other program guide data using a local interactive television program guide. There are typically multiple pieces of user television equipment 22 and multiple associated communications paths 20, although only one piece of user television equipment 22 and communications path 20 are shown in FIGS. 2a-2d to

avoid overcomplicating the drawing. Television distribution facility 16 may distribute television programming to user television equipment 22 via communications path 20. If desired, television programming may be provided over separate communications paths (not shown).

For clarity, the present invention is illustrated, unless otherwise indicated, in connection with a system arrangement in which program guide data is distributed from a main facility to an interactive television program guide implemented on user television equipment via a television distribution facility. 10 Other suitable systems involve arrangements in which data is distributed to a program guide on user television equipment using other suitable distribution schemes, such as schemes involving data transmission over the Internet or the like. If desired, the interactive television program guide application 15 may be implemented using a client-server architecture in which the primary processing power for the application is provided by a server located at, for example, the television distribution facility or the main facility (e.g., program guide server 25), and user television equipment 22 acts as a client 20 processor as illustrated by FIGS. 2c and 2d. Alternatively, the interactive television program guide may obtain program guide data from the Internet. On-line program guides are described, for example, in Boyer et al. U.S. patent application Ser. No. 08/938,028, filed Sep. 18, 1997, which is hereby 25 incorporated by reference herein in its entirety.

An illustrative arrangement for user television equipment 22 is shown in FIG. 3. User television equipment 22 of FIG. 3 receives video and data from television distribution facility 16 (FIG. 1) at input 26. During normal television viewing, the 30 user tunes set-top box 28 to a desired television channel. The signal for that television channel is then provided at video output 30. The signal supplied at output 30 is typically either a radio-frequency (RF) signal on a predefined channel (e.g., channel 3 or 4), or a analog demodulated video signal, but 35 may also be a digital signal provided to television 36 on an appropriate digital bus (e.g., a bus using the Institute of Electrical and Electronics Engineers (IEEE) 1394 standard, (not shown)). The video signal at output 30 is received by optional secondary storage device 32.

Secondary storage device 32 can be any suitable type of analog or digital program storage device or player (e.g., a videocassette recorder, a digital video disc (DVD) player, a hard-disk based storage device, etc.). Program recording and other features may be controlled by set-top box 28 using 45 control path 34. If secondary storage device 32 is a videocassette recorder, for example, a typical control path 34 involves the use of an infrared transmitter coupled to the infrared receiver in the videocassette recorder that normally accepts commands from a remote control such as remote control 40. 50 Remote control 40 may be used to control set-top box 28, secondary storage device 32, and television 36.

The interactive television program guide may run on settop box 28, on television 36 (if television 36 has suitable processing circuitry and memory), on secondary storage 55 device 32 or on optional digital storage device 31 (if they have suitable processing circuitry and memory) or on a suitable analog or digital receiver connected to television 36. The interactive television program guide may also run cooperatively on both television 36 and set-top box 28. Interactive television application systems in which a cooperative interactive television program guide application runs on multiple devices are described, for example, in Ellis U.S. patent application Ser. No. 09/186,598, filed Nov. 5, 1998, which is hereby incorporated by reference herein in its entirety.

If desired, the user may record programs and program data in digital form on optional digital storage device 31. Digital 8

storage device 31 may be a writable optical storage device (such as a DVD player capable of handling recordable DVD discs), a magnetic storage device (such as a disk drive or digital tape), or any other digital storage device. Interactive television program guide systems that have digital storage devices are described, for example, in Hassell et al. U.S. patent application Ser. No. 09/157,256, filed Sep. 17, 1998, which is hereby incorporated by reference herein in its entirety.

Digital storage device **31** can be contained in set-top box **28** or it can be an external device connected to set-top box **28** via an output port and appropriate interface. If necessary, processing circuitry in set-top box **28** formats the received video, audio and data signals into a digital file format. Preferably, the file format is an open file format such as the Motion Pictures Expert Group (MPEG) MPEG-2 standard. The resulting data is streamed to digital storage device **31** via an appropriate bus (e.g., a bus using the Institute Electrical and Electronics Engineers (IEEE) 1394 standard), and is stored on digital storage device **31**. Digital storage device **31** and secondary storage device **32** may be integrated into a sophisticated set-top box if desired.

Television 36 receives video signals from secondary storage device 32 via communications path 38. The video signals on communications path 38 may either be generated by secondary storage device 32 when playing back a prerecorded storage medium (e.g., a videocassette or a recordable digital video disc), by digital storage device 31 when playing back a pre-recorded digital medium, may be passed through from set-top box 28, may be provided directly to television 36 from set-top box 28 if secondary storage device 32 is not included in user television equipment 22, or may be received directly by television 36. During normal television viewing, the video signals provided to television 36 correspond to the desired channel to which the user has tuned with set-top box 28. Video signals may also be provided to television 36 by set-top box 28 when set-top box 28 is used to play back information stored on digital storage device 31.

Set-top box 28 may have communications device 37 for communicating with remote program guide access device 24 over remote access link 19. Communications device 37 may be, for example, a communications port (e.g., a serial port, parallel port, universal serial bus (USB) port, etc.), modem (e.g., any suitable analog or digital modem, cellular modem, or cable modem), network interface card (e.g., an Ethernet card, token ring card, etc.), wireless transceiver (e.g., an infrared transceiver or other suitable transceiver), or other suitable communications device. Television 36 may also have such a suitable communications device connected to remote access link 19 if desired.

If desired, there may be multiple installations of user television equipment 22 within the home connected via an inhome network. This may provide for coordinating the functionality of multiple guides within the home. Systems in which the functionality of multiple guides are coordinated are described, for example, in concurrently filed Ellis et al. U.S. patent application Ser. No. 09/356,161, filed Jul. 16, 1999, which is hereby incorporated by reference herein in its entirety. In such systems, remote program guide access device 24 may be connected via remote access link 19 to one of the guides and may provide users with the ability to remotely coordinate the functions of all of the guides.

A more generalized embodiment of user television equipment 22 of FIG. 3 is shown in FIG. 4. As shown in FIG. 4, program guide data from television distribution facility 16 (FIGS. 2a-2d) is received by control circuitry 42 of user television equipment 22. Control circuitry 42 may also send

data and commands or requests back to television distribution facility **16**. The functions of control circuitry **42** may be provided using the set-top box arrangement of FIGS. **2***a* and **2***b*. Alternatively, these functions may be integrated into an advanced television receiver, personal computer television (PC/TV), or any other suitable arrangement. If desired, a combination of such arrangements may be used.

The user controls the operation of user television equipment 22 with user interface 46. User interface 46 may be a pointing device, wireless remote control, keyboard, touchpad, voice recognition system, or any other suitable user input device. To watch television, the user instructs control circuitry 42 to display a desired television channel on display device 45. Display device 45 may be a television, monitor, or other suitable display device. To access the features of the program guide, the user instructs the program guide implemented on interactive television program guide equipment 17 to generate a main menu or other desired program guide display screen for display on display device 45.

User television equipment 22 of FIG. 4 may also have 20 communications device 51 for supporting communications between user television equipment 22 and remote program guide access device 24 over remote access link 19. Communications device 51 may be a communications port (e.g., a serial port, parallel port, universal serial bus (USB) port, etc.), 25 modem (e.g., any suitable analog or digital standard, cellular, or cable modem), network interface card (e.g., an Ethernet card, Token ring card, etc.), wireless transceiver (e.g., an infrared, radio, or other suitable analog or digital transceiver), or other suitable communications device.

User television equipment 22 may also have secondary storage device 47, digital storage device 49, or any suitable combination thereof for recording programming. Secondary storage device 47 can be any suitable type of analog or digital program storage device (e.g., a videocassette recorder, a digital video disc (DVD), etc.). Program recording and other features may be controlled by control circuitry 42. Digital storage device 49 can be, for example, a writable optical storage device (such as a DVD player capable of handling recordable DVD discs), a magnetic storage device (such as a 40 disk drive or digital tape), or any other digital storage device.

An illustrative arrangement for remote program guide access device 24 is shown in FIG. 5. As shown in FIG. 5, remote program guide access device 24 may be any suitable personal computer (PC), portable computer (e.g., a notebook 45 computer), palmtop computer, handheld personal computer (H/PC), display remote, touch-screen remote, automobile PC, personal digital assistant (PDA), or other suitable computer based device. Remote program guide access device 24 may have user interface 52, processing circuitry 54, storage 50 56, and communications device 58. User interface 52 may be any suitable input or output device or system, and may include a pointing device, keyboard, touch-pad, touch screen, pen stylus, voice recognition system, mouse, trackball, cathode ray tube (CRT) monitor, liquid crystal display (LCD), 55 voice synthesis processor and speaker, or any other suitable user input or output device. Processing circuitry 54 may include any suitable processor, such an Intel 486 or Pentium® microprocessor. Remote program guide access device 24 may also have storage 56. Storage 56 may be any suitable memory 60 or other storage device, such as RAM, ROM, flash memory, a hard disk drive, etc.

Remote program guide access device 24 may also have communications device 58. Communications device 58 may be any device suitable for supporting communications 65 between remote program access device 24 and interactive television program guide equipment 17 over link 19, such as

10

a communications port (e.g., a serial port, parallel port, universal serial bus (USB) port, etc.), modem (e.g., any suitable analog or digital standard modem or cellular modem), network interface card (e.g., an Ethernet card, token ring card, etc.), wireless transceiver (e.g., an infrared, radio, or other suitable analog or digital transceiver), or other suitable communications device.

Remote access link 19 (FIG. 1) may include any suitable transmission medium. Link 19 may include, for example, a serial or parallel cable, a dial-up telephone line, a computer network or Internet link (e.g., 10Base2, 10Base 5, 10BaseT, 100BaseT, 10BaseF, T1, T3, etc.), an in-home network link, an infrared link, a radio frequency link, a satellite link, any other suitable transmission link or suitable combination of such links. Any suitable transmission or access scheme may be used such as standard serial or parallel communications, Ethernet, Token Ring, Fiber Distributed Data Interface (FDDI), Circuit-Switched Cellular (CSC), Cellular Digital Packet Data (CDPD), RAM mobile data, Global System for Mobile communications (GSM), time division multiple access (TDMA), code division multiple access (CDMA), any other suitable transmission or access scheme, or any suitable combination thereof. Preferably remote access link 19 is bidirectional. If desired, however, certain limited program guide functions may be accessed using a unidirectional link. An advantage of using a unidirectional scheme for link 19 is that such schemes are generally less complicated and then less expensive than bidirectional links.

Remote program guide access device 24 and interactive television program guide equipment 17 may communicate over remote access link 19 using any suitable network and transport layer protocols, if desired. Remote program guide access device 24 and interactive television program guide equipment 17 may communicate, for example, using a protocol stack which includes Sequenced Packet Exchange/Internetwork Packet Exchange (SPX/IPX) layers, Transmission Control Protocol/Internet Protocol (TCP/IP) layers, Appletalk Transaction Protocol/Datagram Delivery Protocol (ATP/DDP) layers, or any other suitable network and transport layer protocols or combination of protocols.

Remote program guide access device 24 may communicate with interactive television program guide equipment 17 using any suitable scheme. Remote program guide access device 24 may, for example, connect to interactive television program guide equipment 17 using a terminal emulation scheme, such as VT100 terminal emulation, and access the interactive television program guide as if it were a "dumb terminal." Remote program guide access device 24 may, for example, run a standard remote access client such as a Windows® Remote Access Services (RAS) client and may connect to a Windows NT® Server process running on interactive television program guide equipment 17. Any suitable combination of hardware and software may be used. In addition to using any of the already mentioned protocols, any number of other access, data-link, network, routing or other protocols may be involved in supporting communications between remote program guide access device 24 and television distribution facility 16 over remote access link 19 (e.g., X.25, Frame Relay, Asynchronous Transfer Mode (ATM), Serial Line Interface (SLIP), point-to-point protocols (PPP), or any other suitable access, data-link, network, routing or other protocol).

FIGS. 6a and 6b show illustrative arrangements for supporting communications between remote program guide access device 24 and interactive television program guide equipment 17 over an Internet link. Television distribution facility 16 may, for example, include Internet service system

61 for providing Internet-based access to the program guide. Internet service system 61 may be any combination of hardware and software capable of providing an Internet connection to the programming guide. Remote program guide access device 24 may establish an Internet session with Internet service system 61 and thereby obtain program guide data from or set program guide settings with (e.g., set reminders or notifications, view listings, schedule program recording, set favorites, set parental control features, send messages, poll interactive television program guide equipment 17, etc.) the program guide running on interactive program guide equipment 17. If desired, Internet service system 61 may be located at a facility that is separate from television distribution facility

Program guide server 25 may, in turn, interact with the user's client device (e.g., user televison equipment 22). If the program guide is implemented on user television equipment 22 of program guide equipment 17 as shown in FIG. 6a, Internet service system 61 (or other suitable equipment at 20 television distribution facility 16 that is connected to Internet service system 61) may interact with user television equipment 22 directly or via program guide distribution equipment 21 when supporting communications between the program guide and the remote program guide access device. If the 25 program guide implemented on interactive television program guide equipment 17 is a client-server guide as shown in FIG. 6b, Internet service system 61 may interact with program guide server 25 when supporting communications between the program guide and the remote program guide access device 24. Alternatively, Internet service system 61 and program guide server 25 may be the same device or system.

In an illustrative system configuration using Internet service system 61, remote program guide access device 24 is a user's personal computer at work, Internet service system 61 is a web server at a cable system headend, and user television equipment 22 at the user's home contains a set-top box on which the user's program guide is implemented. Using this 40 arrangement, the user may access features of the program guide such as setting reminders or notifications, viewing listings, program recording, setting favorites, parental control, sending messages, polling for status, or any other suitable function. For example, if a child in the user's home desires 45 permission to watch a parentally controlled program while the user is a at work, the user may access a suitable web page provided by Internet service system 61 that allows the user to enter a password and adjust the program guide parental control settings. The changed settings allowing the child access to 50 the desired program are then automatically transferred from Internet service system 61 to user television equipment 22, while the user is still at work.

As another example, the user at work may interact with the program guide on user television equipment 22 via Internet 55 service system 61 to select programs for recording on the user's home videocassette recorder, or to schedule program reminders that will appear on the user's home television or remote program guide access device just before a program is broadcast.

FIG. 6c shows another illustrative arrangement for remote program guide access using the Internet. In the system arrangement of FIG. 6c, users do not directly communicate a local guide via the Internet as with the arrangements of FIGS. 6a and 6b. Instead, users may have personal computer (PC) 65 231 as their remote access device on which a web browser is implemented for accessing an on-line program guide. On-line

12

program guides are described, for example, in above-mentioned Boyer et al. U.S. patent application Ser. No. 08/938, 028, filed Sep. 18, 1997.

Personal computer 231 may be connected to Internet service system 235 via Internet link 233. Internet service system 233 may use any suitable combination of computer hardware and software capable of providing an on-line program guide server application or web site. The user may access a personal web page and set various program guide settings and access various program guide functions. The user may, for example, set favorite channels, set parental control settings, schedule programs for play back or recording by the user's television equipment. After the user has set various program guide settings or accessed various program guide functions via a web page, Internet service system 235 may provide the settings and another program guide information to Internet service system 61 for distribution by program guide server 25 or distribution equipment 21 (as shown) to user television equipment 22. The local guide updates its settings, records programs, plays back programs, or performs any other suitable function accordingly. The local guide may also order pay-perview programs.

A remote access interactive television program guide may, for example, be implemented on remote program guide access device 24. The remote access interactive television program guide may communicate with the interactive television program guide that is implemented on interactive television program guide equipment 17, herein referred to as a "local" interactive television program guide. The remote access and local guide may, for example, be the same guide but compiled to run on two different platforms and to communicate in a manner or manners discussed herein. Alternatively, the remote access guide may be a client guide that communicates with the local guide (i.e., a server guide). In still another suitable approach, the two guides may be different guides that communicate in a manner or manners discussed disclosed herein. Generally, although not necessarily (e.g., when remote program guide access device 24 is a personal computer as shown in FIG. 6c), the remote access interactive television program guide may have a reduced or limited functionality when compared to the functionality of the local interactive television program guide. Accordingly, the remote access guide may require less processing power and memory of remote program guide access device 24 than the local guide requires of interactive television program guide equipment 17.

Program guide information (e.g., reminder information, listings information, recording information, message information, status information, parental control settings, audio and video, status or polling information, user information, favorites settings, or any other information necessary for remotely providing program guide functionality) may be exchanged, and settings set, between the two interactive television program guides over remote access link 19 using one or more access communications.

Access communications may include, for example, commands, requests, messages, remote procedure calls (e.g., using a proxy-stub pair), or any other suitable client-server or peer-to-peer communication. Access communications may also involve, for example, complex communications between application constructs running on remote program guide access device 24 and interactive television program guide equipment 17. Objects running in the two versions of the program guides, for example, may communicate using an Object Request Broker (ORB). The program guide information may, for example, be encapsulated as component object model (COM) objects and persisted to files that are transmit-

ted over remote access link **19**. In another approach, access communications may include HTML formatted markup language documents (e.g., web pages), that are exchanged between remote program guide access device **24** and interactive television program guide equipment via Internet service system **61**.

Program guide information may be transferred, and program guide settings set, between remote program guide access device **24** and interactive television program guide equipment **17** using any suitable application layer protocol if desired. If link **19** is an Internet link, for example, program guide functionality may be accessed by, for example, using the Hypertext Transfer Protocol (HTTP). Remote program guide access device **24** and interactive television program guide equipment **17** may, for example, transfer program guide information as files using the File Transfer Protocol (FTP) or Trivial File Transfer Protocol (TFTP), running over a TCP/IP protocol stack. Any suitable file transfer protocol based on any suitable protocol stack may be used.

Remote program guide access device **24** and interactive television program guide equipment **17** may also exchange program guide data and other information as messages using any suitable messaging scheme or messaging application programming interface (API). Program guide data and other 25 information may, for example, be encapsulated into e-mail messages and transferred using the Simple Mail Transfer Protocol (SMTP), Messaging API (MAPI), or other suitable messaging protocol or API.

Remote program guide access device 24 and the interactive 30 television program guide implemented on interactive program guide equipment 17 may exchange access communications to provide the user with access to program guide functionality as if the program guide were running locally on remote program guide access device 24. Remote program 35 guide access device 24 may provide a user with access to any number of program guide functions such as accessing programming information, scheduling reminders for programs, setting and navigating through favorite channels, setting parental control settings, scheduling programming record- 40 ings, or any other program guide function to the extent allowed by the resources of remote program guide access device 24. If desired, remote program guide access device 24 may allow the user to perform other program guide functions, such as determining the status of user television equipment 45 22, sending messages to user television equipment 22, interacting with peripherals connected to user television equipment, and other suitable functions.

When the user wishes to access the features of the program guide via remote program guide access device 24, the user 50 may issue an appropriate command using user interface 52 (FIG. 5). For example, if the user wishes to view programming information, a "guide" key on user interface 52 can be used. If, for example, user interface 52 includes a microphone and uses suitable voice recognition software, the user may 55 speak a predetermined command into the microphone. Such an interface is especially useful in environments where remote program guide access device 24 must be operated without the use of one's hands, as with an automobile PC.

When possible, remote program guide access device 24 60 may present program guide data and other information to the user as they are normally presented by user television equipment 22. In practice, appropriate differences in presentation may occur depending on the interface devices used in user television equipment 22 and remote program guide access 65 device 24 (e.g., user television equipment 22 may use a television to output listings and remote program guide access

14

device **24** may include a voice recognition and synthesis system to output synthesized voice listings).

When a user indicates a desire to access program guide features by issuing an appropriate command to remote program guide access device 24, remote program guide access device 24 may, for example, access stored program guide information or obtain program guide information from interactive television program guide equipment 17 via remote access link 19 using any of the approaches already described, and generate an appropriate display screen for display using user interface 52. Alternatively, the local interactive television program guide implemented on interactive television program guide equipment 17 may receive one or more access communications from remote program guide access device 24 over link 19, generate the appropriate program guide display screen, and send the program guide display screen back to remote program guide access device 24 for display on user interface 52. In another embodiment, a remote access guide 20 may run on remote program guide access device 24 and issue access communications over remote access link 19 as if it were running as a client locally on interactive television program guide equipment 17. In another embodiment, remote program guide access device 24 may access a web site and view web pages that contain program guide information.

The remote access program guide running on remote program guide access device 24 may provide a user with an opportunity to remotely access program listings. A person driving an automobile, for example, may issue a suitable vocal command that is recognized by interface 52. The remote access program guide may issue one or more access communications to the local program guide, which in turn supplies program listings information back to remote program guide access device 24. User interface 52 may, for example, provide the listings to the user in synthesized voice outputs

The program listings may also, for example, be displayed in a program listings screen by a suitable display device. A program listings screen may contain one or more lists of programs organized according to one or more organization criteria (e.g., by program type, theme, or any other predefined or user defined and selectable criteria) and sorted in various ways (e.g., alphabetically). One approach is to organize program listings into a program listings grid. As shown in FIG. 7, program listings display screen 148 may contain program listings area 168. Program listings area 168 may display television program listings in any suitable format, such as any suitable list, table, or grid.

FIG. 7 illustrates the display of program listings in program listings grid 150. Program listings grid 150 may be divided into a number of columns 162 which correspond to program broadcast times and which may be equally spaced apart (e.g., in thirty-minute steps). Program listings may be displayed in the grid in sub-sets according to predefined or selectable organization criteria and sorted in various ways. Program listings row 152 contains, for example, selectable program listings for THE DESERTS OF AFRICA and WILDLIFE on channel 46 (Public Television). Program listings row 154 contains, for example, selectable program listings for GHOST and TITANIC on channel 47 (HBO). Program listings row 156 contains, for example, selectable program listings for programs BLUES BROTHERS on channel 48 (VH-1). Program listing row 158 contains selectable program listings for programs, PPV 1, and PPV 2 on channel 49 (ADU). Program listings row 160 contains a selectable program listing for COOKING on channel 50 (WPTU). The programs on each channel are typically different.

Program listings grid 150 may have movable cell highlight region 151, which highlights the current grid cell. The user may position highlight region 151 by entering appropriate commands with user interface 52. For example, if user input interface 52 has a keypad, the user can position highlight 5 region 151 using "up," "down," "left," and "right" cursor keys. Remote program listings may also be panned left, right, up, and down by positioning highlight region 151 using the cursor keys on user interface 52. Alternatively, a touch sensitive screen, trackball, voice commands, or other suitable 10 device may be used to move highlight region 151 or to select program listings without the use of highlight region 151. In still another approach, the user may speak the title of a television program listing into a voice request recognition system which will issue an appropriate command or request to 15 remote program guide access device 24. Any other suitable approach may also be used.

After a user selects a program listing, the remote access program guide may provide the user with the opportunity to access a number of program guide features. For example, the 20 user may access additional information (typically text or graphics, but possibly video if desired) about the listing, schedule an associated program reminder, schedule an associated program for recording by one or more of digital storage device 31 (FIG. 3), secondary storage device 32 (FIG. 3), 25 storage 56 (FIG. 5), or program guide server 25.

Program listings may also be displayed for the user in a list. FIG. 8 illustrates a program listings display screen having a program listings list displayed in accordance with the principles of the present invention. Scrollable program listings 30 lists may display program listings in subsets according to predefined or user-selected organization criteria. Any suitable organization criteria and sorting scheme may be used. Scrollable program listings list 170 of FIG. 8, for example, organizes program listings according to program type and then 35 sorts the listings alphabetically in each subset. The television program listings display screen of FIG. 8 also has movable cell highlight region 171 for moving within the list and selecting listings.

The remote access program guide may also provide a user 40 with the opportunity to remotely schedule program reminders when the user indicates a desire to set a program reminder (e.g., by pressing a "reminder" button on user interface 52, selecting an on screen "reminder" button, issuing an appropriate vocal command, etc.). The remote access program 45 guide may transmit one or more access communications to the local interactive television program guide implemented on interactive television program guide equipment 17 to schedule the reminder. Alternatively, the remote access program guide may, for example, store a reminder locally on 50 storage 56 of remote program guide access device 24 (FIG. 5). Information indicating the user who set the reminder may also be stored on interactive program guide equipment 17 or storage **56**. Reminders may also be scheduled by a user with the local guide, transmitted to remote program guide access 55 device 24, and displayed by the remote access guide on remote program guide access device 24.

At an appropriate time before the selected program is scheduled to air (e.g., a predefined user-selectable number of minutes, hours or days), a reminder may be issued by the local 60 or remote interactive television program guides, or both. The reminder may be issued on all remote program guide access devices 24 available to the user, and may be displayed (e.g., in the form of a pop-up window or message) on user television equipment 22. If a reminder for a program is to be displayed 65 on the user's home television, the reminder may be displayed just before the beginning of the program. If a reminder for a

16

program is to be displayed on remote program guide access device **24**, the reminder may be displayed much earlier (e.g., several hours before the program).

In another approach, reminders may be sent as e-mail messages from the interactive television program guide to remote program guide access device 24. Interactive program guide systems in which reminders are sent to users via e-mail are described, for example, in Boyer et al. U.S. patent application Ser. No. 08/987,740, filed Dec. 9, 1997, which is hereby incorporated by reference herein in its entirety. In still another approach, user interface 52 may include an alphanumeric pager (among other suitable devices for providing bidirectional communications with the program guide via remote access link 19). The interactive program guide implemented on interactive television program guide equipment 17 may phone an automatic paging service (e.g., by using a suitable modem and communications software), and issue a message similar to the one contained in notification 177. An illustrative reminder 177 for display on display device 45 (FIG. 4) or user interface 52 (FIG. 5) is shown in FIG. 9.

The remote access program guide may also provide a user with the opportunity to remotely access and adjust the parental control settings of the local interactive television program guide implemented on interactive television program guide equipment 17. The remote access program guide, for example, may provide users with an opportunity to block potentially objectionable programs or channels using a parental control code (e.g., a personal identification number (PIN) code). Users my also selectively unlock blocked channels or programs. If desired, the user may remotely access parental control settings related to blocking the display of potentially objectionable program listings.

The remote access program guide may obtain parental control information (e.g., which channels, services, programs, genres or types of program listings may be locked, maximum rating information, PIN information, etc.), from the local program guide implemented on interactive television program guide equipment 17 over remote access link 19 in any suitable manner. Remote program guide access device 24 may, if desired, store parental control information on storage 56. Information indicating the user who accessed and adjusted parental control settings may be stored by the program guide or remote program guide access device 24.

Remote program guide access device 24 may provide a user with the opportunity to remotely parentally control television programming by, for example, providing the user with the opportunity to select a television program listing and issue an appropriate command using user interface 52 (e.g., by pressing a displayed "lock" button, using a pointing device or touch sensitive screen, issuing an appropriate vocal command, etc.). Remote program guide access device 24 may indicate to a user that a channel, service, program, or genre is locked by, for example, generating an appropriate notice, icon, synthesized voice response, message, or any other suitable indication. FIGS. 7 and 8 illustrate the use of lock icon 310 for indicating, for example, that television service ADU is locked.

The remote access program guide may also provide users with an opportunity to remotely access interactive television program guide functionality related to user preferences or "favorites" settings. For example, remote program guide access device 24 may access features for setting-up and navigating through favorite channels or programs. Interactive television program guide systems in which program guide data is displayed according to preference profiles are described, for example, in Ellis et al. U.S. patent application

Ser. No. 09/034,934, filed Mar. 4, 1998, which is hereby incorporated by reference herein in its entirety.

The remote access program guide may obtain information on the user's preferences (e.g., which channels or programs are favorites, favorite themes, likes and dislikes etc.) from the local interactive television program guide implemented on interactive television program guide equipment 17 in any suitable manner. The remote access program guide may, if describe patent all the channel settings and other preferences based on the favorites information. Remote program guide access device 24 may transmit changed or new favorites information to interactive television program equipment 17 via remote access link 19 using one or more access communications. Information indicating the user who changed the profiles may also be stored by the local or remote access program guides.

The information on the user's preferences may be used by the local and remote access interactive program guides to navigate through favorite channels and display television pro- 20 gram listings. FIG. 10 shows an illustrative program listings display screen that may be displayed by the remote access program guide on remote program guide access device 24 using user interface 52. The display screen includes a number of channels that have been selected as favorites (e.g., channels 25 2, 4, 7, 47 and 48). Alternatively, remote program guide access device 24 may, for example, display television program listings in a grid, table, or list while highlighting favorite channels or preferred programs. A user may be provided with the opportunity to "scroll" between favorite listings or channels by issuing an appropriate command using user interface **52**. In still another suitable approach, remote program guide access device 24 may display program guide data for only those programs or channels that are of interest to users as defined by the profiles.

User preference profiles may also be used to limit the amount of data provided to remote program guide access device **24** and thereby tend to minimize the bandwidth requirements of remote access link **19**. Data filtering may be performed, for example, by the local interactive guide according to the user profiles when transferring data to remote program guide access device **24**. Only data for those programs or channels that are of interest to the user may be transferred if desired. Alternatively, data filtering may be performed, for example, by program guide server **25** or Interact service system **61**.

The remote access program guide may also provide the user with the opportunity to remotely schedule recordings using the local interactive program guide. The user may, for example, select a program listing using user interface 52 50 (FIG. 5) and issue an appropriate command (e.g., pushing an on-screen "button," issuing an appropriate voice command, etc.). The remote access program guide may respond by sending one or more access communications to the local interactive program guide implemented on interactive television 55 program guide equipment 17 with the remote program guide access device 24 to record the program associated with the selected listing when the program is aired. The local program guide may store the program on secondary storage device 32, digital storage device 31, or on storage 56 of remote program 60 guide access device 24. Information indicating the user who scheduled a program for recording may also be stored by the program guide or remote program guide access device 24. If the programming is stored on storage 56, it may be transmitted to remote program guide access device 24 in any suitable 65 format (e.g., as National Television Standards Committee (NTSC) video, as MPEG-2 files, etc.), and may be converted

18

to a digital format by a suitable analog to digital converter in remote program guide access device **24** if necessary (not shown). Any suitable transmission scheme may be used, such as using FTP if files are transferred, for example, across an Internet link. Programs may also be recorded by program guide server **25**. Program guide systems in which user selected programs are stored by a program guide server are described, for example, in above-mentioned Ellis et al. U.S. patent application Ser. No. 09/332,244, filed Jun. 11, 1999.

If desired, program series may be recorded. Interactive television program guide systems in which program series are recorded are described, for example, in Knudson et al. U.S. patent application Ser. No. 09/330,792, filed Jun. 11, 1999, which is hereby incorporated by reference herein in its entirety.

Program guide information may also be stored by the remote access interactive television program guide on storage 56. User settings and profiles, video clips, and detailed descriptive information may also be stored. Storing programming or data on storage 56 may be appropriate in situations, for example, where the data is required to be maintained across a power outage, or if the volume of data that the interactive program guide must store during normal operation is more than interactive television program guide equipment 17 can handle.

The remote access program guide may also provide a user with an opportunity to remotely order pay-per-view programs and packages. The remote access program guide may, for example, provide the user with an opportunity to select a pay-per-view program or package listing using user interface 52 (e.g., by using a pointing device, touch sensitive screen, or issuing a voice command to select a pay-per-view program listing). In response to the user command, remote program guide access device 24 may obtain pay-per-view information (e.g., price, ordering information, time, event code, etc.) from the interactive television program guide running on interactive television program guide equipment 17, via remote access link 19. Alternatively, the pay-per-view information may have been provided to remote program guide access device 24 by the local guide, program guide server 25, or Internet Service system **61**.

The remote access program guide may provide the payper-view information to the user using user interface 52, and may provide the user with the opportunity to order the payper-view selection. Once the user issues an appropriate command to remote program guide access device 24 to order the pay-per-view selection, the remote access guide on remote program guide access device 24 may indicate to the local guide implemented interactive program guide equipment 17 (e.g., via one or more access communications) the program that the user wishes to order. The local interactive program guide may respond by ordering the pay-per-view program from television distribution facilitating 16 or some other distribution facility. Alternatively, the remote access program guide may order the pay-per-view program from television distribution facility 16 (or some other distribution facility) and indicate the ordered pay-pay-view to the local guide so that ordering related functions may be coordinated.

Remotely ordering pay-per-view programs via the local interactive guide as opposed to ordering pay-per-view programs directly from a headend by phone, internet, or impulse ordering using the remote access guide may allow the local program guide to perform functions that it would not ordinarily be able to perform. Ordering a pay-per-view through the local guide as opposed to directly from television distribution facility 16 may allow the local guide to, for example, parentally control the ordering of a program, inform the user

that the program is about to start, inform the user that the user has missed an ordered pay-per-view program, provide the user with an opportunity to reorder the program, or any other suitable function associated with ordering a pay-per-view program.

The remote access program guide may also provide the user with an opportunity to remotely access video and audio (either together or separately) that is being distributed to the local interactive television program guide or which has been stored by the local interactive television program guide on 10 user television equipment 22 or at a remote server. In response to an appropriate user command on user interface device 56, the remote access program guide may, for example, query the interactive television program guide for media directory information stored on digital storage device 31 or secondary 15 storage device 32. Interactive television program guides which store programming using a digital media directory are described, for example, in the previously mentioned Ellis et al. U.S. patent application Ser. No. 09/157,256.

The remote access program guide may provide the user 20 with the opportunity to select a directory entry or may, for example, provide the user with an opportunity to select a program listing of a television program that is being broadcast. In response to either selection, the remote access program guide may issue an appropriate access communication 25 to the interactive television program guide to play back or tune to the selection and transmit it back to remote program guide access device 24 over remote access link 19. Remote program guide access device 24 may play the video or audio for the user. In one approach, for example, remote program 30 guide access device 24 may provide a user with the opportunity to access audio from a digital music channel which is received by interactive television program guide equipment 17, and play the audio on a speaker or by using an audio device that may be contained in user interface 52 (e.g., a car 35

Video and audio may be transmitted from interactive television program guide equipment 17 to remote program guide access device 24 over remote access link 19 in any suitable format (e.g., as NTSC video, as MPEG-2 files, using the 40 M-bone, etc.), and may be converted to a digital format if necessary by a suitable analog to digital converter in remote program guide access device 24 (not shown). Any suitable transmission scheme may be used.

The remote access program guide may also provide a user 45 with the opportunity to poll the local interactive television program guide to determine the status of interactive television program guide equipment 17 or, more specifically, user television equipment 22. For example, the remote access program guide may obtain information regarding whether the 50 interactive television program guide is in use, what channel user television equipment 22 is tuned to, the title of the current program, the rating of the current program, the status of remote access link 19, available devices, etc. Any suitable scheme may be used, such as using a Simple Network Man- 55 agement Protocol (SNMP) approach in which a management client process runs as part of the interactive television program guide implemented on interactive television program guide equipment 17, and in which a management server process runs on remote program guide access device 24.

When the user issues an appropriate command using user interface device **56** (e.g., by pressing a button on a key pad, selecting an on-screen option or button, issuing an appropriate voice command, etc.), the remote access program guide may respond by issuing an access communication to the 65 interactive program guide over remote access link **19** using remote program guide access device **24**. The interactive pro-

20

gram guide may respond by transmitting the desired status information back to remote program guide access device 24 over remote access link 19, or by transmitting a display screen (if appropriate). The remote access program guide may indicate the status of interactive television program guide equipment 17 on remote program guide access device 24 using any suitable indicator (e.g., a display screen, synthesized voice responses, etc.). An illustrative status display screen 200 for display using user interface 52 is shown in FIG. 11.

The remote access program guide may also provide a user with an opportunity to control user television equipment 22 remotely. A user may, for example, position highlight region 201 over a setting, select the setting, and change its value. The user may, for example, change the current channel, the current volume, or control user television equipment 22 in any other suitable manner.

The remote access program guide may also provide a user with the opportunity to send audio, graphical, and text messages to the local interactive program guide for playing or display by user television equipment 22. For example, the remote access program guide may receive a voice message from the user using user interface device 24. That voice message may be converted to a digital signal by an analog-todigital converter in remote program guide access device 24 if necessary, and sent to the interactive television program guide over remote access link 19. Once received, the local interactive television program guide may play (or display) the message on user television equipment 22. If desired, messages created by a user on the local interactive television program guide or by an operator of television distribution facility 16 may be sent to remote program guide access device 24. The remote access program guide may in turn provide the messages to the user using remote program guide access device

FIGS. 12-24 are illustrative flow charts of steps involved in providing remote access to functions of a local interactive television program guide in accordance with the principles of the present invention. The steps shown in FIGS. 12-24 are illustrative and may be performed in any suitable order. Moreover, in practice it may be desirable to combine or delete various steps or combinations of steps shown in the flow charts.

FIG. 12 shows illustrative steps involved in providing remote access to the various program guide functions. At step 1200, a remote access link is established between the remote access program guide implemented on remote program guide access device 24 and the interactive television program guide implemented on interactive television program guide equipment 17 using remote access link 19. At step 1210, the remote access program guide provides the user with the opportunity to remotely access functions of the interactive program guide over the remote access link.

The remote access program guide may, for example, obtain a user command from the user that indicates a desired pro55 gram guide function using remote program guide access device 24 (substep 1265) and then remotely provide the indicated program guide function to the user. A user may indicate a desired function by entering an appropriate command using user interface 52. The user may, for example, enter a command using a keyboard, speak a command into a microphone, select an on-screen button using a pointing device, or any other suitable approach.

The indicated program guide function may be remotely provided to the user audibly (substep 1270) using, for example, a speaker, car stereo, or other device capable of producing sounds that suitably indicate to the user program guide information. Alternatively, the indicated program guide

function may be remotely provided to the user visually (at substep **1280**), for example, by using a monitor, LCD, or other display device.

Establishing the remote access link between the remote access program guide and the local interactive television program guide implemented on interactive television program guide equipment 17 as indicated by step 1200 and providing the user with an opportunity to remotely access functions of the local interactive television program guide over remote access link 19 (step 1210) may depend on the configuration of the interactive television program guide system. FIGS. 13a-13e show illustrative variations of steps 1200 and 1210 of FIG. 12 for establishing remote access link 19 and for providing the user with remote access to program guide functions for the illustrative systems 10 of FIGS. 2a-2d and FIGS. 15 6a-6c.

FIG. 13a illustrates steps involved in establishing remote access link 19 and for providing the user with remote access to program guide functions in the systems of FIGS. 2a and 2c. In these systems, remote access link 19 may be established 20 between the remote access program guide and the interactive television program guide via a communications device in user television equipment 22 (Step 1200a). The local interactive television program guide may be wholly implemented on user television 22 as in system 10 of FIG. 2a, or may be partially 25 implemented on user television equipment 22 as, for example, an interactive program guide client, as in system 10 of FIG. 2c. At step 1210a, remote program guide access device 24 may provide the user with the opportunity to remotely access the functions of the local interactive televi- 30 sion program guide over the remote access link with a communications device.

Remote access link 19 may be established between the remote access program guide and the interactive television program guide via remote program guide access device 24 and a communications device in television distribution facility 16 or other location for a system configured as shown in FIG. 2d. Providing remote access to the functions of the local interactive television program guide in such a system may, for example, involve the steps shown in FIG. 13b. At step 1200b, 40 for example, remote access link 19 may be established with a communications device in television distribution facility 16. The remote access program guide may, for example, provide the user with the opportunity to remotely access functions of the program guide with a communications device in the television distribution facility 16 at step 1210b.

If television distribution facility 16 includes a program guide server as shown in FIG. 2c, remote access link 19 may be established between the remote access program guide and the interactive television program guide via remote program guide access device 24 and a communications device in television distribution facility 16 as indicated by step 1200c of FIG. 13c. At step 1210c remote program guide access device 24 may, for example, provide the user with the opportunity to remotely access the functions of the program guide over 55 remote access link 19 with a communications device in distribution facility 16.

Steps involved in establishing remote access link 19 in on-line program guide systems that communicate with the remote access program guide such as in systems 10 of FIGS. 60 6a and 6b are shown in FIGS. 13d and 13e. In the on-line program guide system of FIG. 6a, for example, remote access link 19 may be established between the local interactive television program guide and the remote access program guide with Internet service system 61 (step 1200d, FIG. 13d). In the 65 client-server on-line program guide system of FIG. 6b, for example, remote access link 19 may be established between

22

the local interactive television program guide and the remote access program guide with an Internet service system in contact with program guide server 25 (step 1200e, FIG. 13e). The remote access program guide may provide the user with the opportunity to remotely access the functions of the program guide at steps 1210d and 1210e of FIGS. 13d and 13e, respectively.

Establishing remote access link 19 at step 1200 of FIG. 12 may also involve exchanging one or more access communications between the interactive television program guide implemented on interactive television program guide equipment 17 and the remote access program guide implemented on remote program guide access device 24, as indicated by substep 1202 of FIG. 14. Access communicators may include any client-server or peer-to-peer communication construct suitable for providing program guide information across remote access link 19. Access communications may include, for example, requests, commands, messages, or remote procedure calls, as indicated by substeps 1204, 1205, 1206, and 1207, respectively.

Access communications may also involve complex communications between application constructs running on remote program guide access device 24 and interactive television program guide equipment 17. Access communications may, for example, be object based, as indicated by substep **1208**. Objects running in two program guides, for example, may communicate using an Object Request Broker (ORB). The program guide information may, for example, be encapsulated as component object model (COM) objects and persisted to files that are transmitted over remote access link 19. Access communications may also include, for example, HTML formatted markup language documents (e.g., Web pages), that are exchanged between remote program guide access device 24 and interactive television program guide equipment 17 via Internet service system 61, as indicated by substep 1209.

FIGS. 15-23 are flowcharts of illustrative steps involved in providing remote access to a number of specific program guide functions. Remote access to the functions may be provided in any interactive television program guide system, such as a system 10 having the arrangements of interactive television program guide equipment 17 shown in FIGS. 2a-2d and FIGS. 6a and 6b. The steps shown in FIGS. 12-14 are not shown in the flowcharts of FIGS. 15-23 to avoid over-complicating the drawings, although any suitable combination or combinations of the steps of the flowcharts of FIGS. 12-23 may be used in practice.

FIG. 15 shows illustrative steps involved in remotely providing program listings information to a user. At step 1600, program listings information is remotely obtained from the local interactive television program guide implemented on interactive television program guide equipment 17 via remote access link 19. The remote access program guide may, for example, obtain this information on startup, periodically, continuously, on demand in response to a suitable user command, or using any other suitable scheme using remote program guide access device 24.

At step 1610, the program listings information may be provided to the user. The program listings information may be displayed for the user by the remote access program guide in a table, listing grid, or other suitable construct, using user interface 52 (substep 1620). Alternatively, program listings information may be provided audibly for the user by using, for example, a speaker (substep 1630).

At step **1640**, the remote access program guide may provide the user with the opportunity to select a program listing. In response to such a selection, the remote access program

guide may provide the user with the opportunity to access other remote program guide features for the listing (e.g., displays additional info, schedule a program reminder, record, parental control, order the program if it is a pay-perview program, etc.).

FIG. 16 shows illustrative steps involved in providing the user with remote access to the program reminder feature of a local interactive television program guide. At step 1700, a user is provided with an opportunity to schedule a programming reminder. The user may be provided with an opportunity to remotely schedule a programming reminder with the local guide or with the remote access guide. This opportunity, may, for example, be provided in response to the user selection of a program listing. At step 1710, the program reminder is scheduled by the local guide or the remote access guide. The program reminder may be scheduled with the local interactive television program guide (substep 1720), may be stored by the remote access interactive television program guide (substep 1730), or both.

At step **1740**, the program reminder is generated at an appropriate time (e.g., a predefined or user-selectable number of minutes, hours, or days) before a program is scheduled to air. The reminder may be generated by the local interactive television program guide implemented on interactive television program guide equipment **17**, or may be generated by the 25 remote interactive television program guide. The program reminder may, for example, be sent to the user via e-mail or alphanumeric page, as indicated by substeps **1750** and **1760** respectively.

FIG. 17 shows illustrative steps involved in providing a 30 user with remote access to the parental control features of the local interactive television program guide implemented on interactive television program guide equipment 17. At step 1800, parental control information is remotely obtained. This may occur, for example, on startup, periodically, continuously, on demand in response to a suitable user command, or using any other suitable scheme.

The remote access program guide may provide the user with the opportunity to parentally control programming (e.g., by program, channel, theme, time, etc.) in any suitable manner (step 1810). At step 1820, the remote access program guide remotely sets a parental control setting with the interactive television program guide via remote access link 19. Remote program guide access device 24 may use, for example, one or more access communications sent over 45 remote access link 19 to exchange the parental control settings with interactive television program guide 17.

Programming may be locked locally by a user via user television equipment 22, or may have been locked remotely by the remote access program guide. The remote access program guide may indicate to a user that programming is locked (e.g., by program, channel, theme, etc.) with remote program guide access device 24 at step 1830. Remote program guide access device 24 may use, for example, a notice, icon, synthesized voice output, message, or any other suitable indicator.

FIG. 18 shows illustrative steps involved in providing a user with remote access to the favorites and user profile functions of the interactive television program guide implemented on interactive television program guide equipment 17. At step 60 1900, user preference profiles are remotely obtained from the local interactive television program guide by the remote access interactive television program guide via remote access link 19. The information or profiles may be obtained, for example, on startup, periodically, continuously, on demand in 65 response to a suitable user command, or using any other suitable scheme.

24

The remote access program guide may provide the user with the opportunity remotely adjust user profiles (step 1910). The user may, for example, add or delete favorite channels, themes, indicate likes or dislikes, etc. At step 1920, the remote access program guide remotely adjusts user profiles with the local interactive television program guide. This may be accomplished by, for example, remote program access device 24 exchanging one or more access communications with interactive television guide equipment 17 via remote access link 19. The one or more access communications may indicate one or more user profiles or favorites information. At step 1925, the remote program guide obtains program guide data according to the preference profiles.

At step 1930, remote program guide access device 24 may provide the user with the opportunity to remotely navigate through favorites. Remote program guide access device 24 may, for example, have obtained program listings information (step 1600, FIG. 15), sorted the information according to the favorites information, and displayed only listings for a favorite channel or theme. Alternatively, remote program guide access device 24 may, for example, display television program listings in a grid, table, or list while highlighting favorite channels. A user may be provided with the opportunity to "jump" between favorite listings or channels by issuing an appropriate command using user interface 52.

FIG. 19 shows illustrative steps involved in providing a user with remote access to program recording. At step 2000, the remote access program guide provides the user with the opportunity to select a program for recording. This opportunity may be provided in response to the user indicating a desire to record programming by, for example, selecting a program listing (step 1640, FIG. 15) and issuing a suitable command. In response, the remote access program guide remotely schedules the program for recording with the local interactive television program guide equipment 17 (step 2000). Remote program guide access device 24 may exchange, for example, one or more access communications with interactive television program guide equipment 17 that are sent over remote access link 19.

At an appropriate time, the program is recorded (step 2020). As indicated by substeps 2030 and 2040, the program may be recorded by the local interactive program guide on interactive television program guide equipment 17 (e.g., digital storage device 31 or secondary storage device 32 of user television equipment 22 (FIG. 3), or on program guide server 25, or may be recorded by remote program guide server 25. If the program is recorded by remote program guide access device 24, the programming may, for example, be digitized and transmitted as a MPEG-2 data stream over remote access link 19 using access communications.

FIG. 20 shows illustrative steps involved in providing the user with remote access to remotely order pay-per-view programs and packages using the local interactive television program guide implemented on interactive television program guide equipment 17. At step 2100, the remote access program guide obtains pay-per-view information (e.g., price, ordering information, time, event code, selections in a package, etc.), from the interactive program guide implemented on interactive television program guide equipment 17 via remote access link 19. The pay-per-view information may be obtained on startup, periodically, continuously, on demand in response to a suitable user command, or using any other suitable scheme. The pay-per-view information is provided to

the user by the remote access program guide using user interface 52 of remote program guide access device 24 in any suitable fashion (step 2110).

At step 2120, the remote access program guide provides the user with the opportunity to remotely order a pay-perview program or package. This opportunity may be provided, for example, in response to the user selecting a pay-per-view program listing or package listing (e.g., step 1640, FIG. 15). At step 2130, the remote access program guide remotely orders the pay-per-view program or package by indicating the program or package to the local interactive television program guide by, for example, exchanging one or more access communications over remote access link 19 (step 2133). The access communications may contain the pay-per-view information for the selected pay-per-view program or package at step 2135. Alternately, the remote access program guide may order the pay-per-view program (step 2137).

The way in which the remote access program guide orders the pay-per-view program using the local interactive televi- 20 sion program guide may depend on the configuration of the system. If the system is configured as shown in FIGS. 2a and 2c, the remote access program guide may, for example, provide the pay-per-view information to the interactive television program guide implemented at least partially on user 25 television equipment 22. The interactive television program guide may, in turn, order the pay-per-view program with television distribution facility 16. If the system is configured as shown in FIGS. 2b and 2d, the remote access program guide may, for example, provide the pay-per-view informa- 30 tion to the interactive television program guide via separate communications device 27. If the system is configured as shown in FIGS. 6a and 6b, the remote access program guide may provide the pay-per-view information via Internet service system 61.

FIG. 21 shows illustrative steps involved in providing a user with access to remotely-played video or audio. At step 2200, the remote access program guide may obtain video or audio information from the interactive television program guide implemented on interactive television program guide equipment 17 via remote access link 19. This may occur, for example, in response to the user selecting a video or audio listing displayed by remote program guide access device 24.

Substeps 2210 and 2220 show illustrative steps involved in obtaining directory information used in providing a user with 45 audio and video information. The remote access program guide may query the local interactive television program guide implemented on interactive television program guide equipment 17 for directory information using one or more access communications that are sent over remote access link 50 19 (step 2210). The directory information may be contained, for example, in a media library directory for a media library that is stored on user television equipment 22, or by television distribution facility 16. The directory information may be provided back to the remote access program guide by 55 exchanging one or more remote access communications between interactive television program guide equipment 17 and remote program guide access device 24 over remote access link 19, as is indicated by substep 2220. Step 2210 may be skipped and step 2220 performed when, for example, 60 directory information or listings are provided to the remote access guide ahead of time.

At step 2230, the remote access program guide may provide the user with the opportunity to select a video or audio for remote playing. The user may select a video or audio by, 65 for example, selecting a listing that is indicated to the user by user interface 52. The user may be provided with an oppor-

26

tunity to play a program in real-time via the local and remote guides, or to play a stored program. In response, the remote access program guide may obtain the selected video or audio from the local interactive television program guide using access communications that are sent over remote access link 19. The access communications may contain the video or audio in a suitable analog or digital format. At step 2250, remote program guide access device 24 remotely plays the video or audio for the user using user interface 52. Selected video may be displayed, for example, on a suitable monitor, LCD, or other suitable display device. Selected audio may be played for the user using any suitable speaker. Audio may, for example, be played by a car stereo if remote program guide access device 24 is an automobile PC.

FIG. 22 shows illustrative steps involved in providing the user with the opportunity to remotely poll the local interactive television program guide implemented on interactive television program guide equipment 17. At step 2300, the remote access program guide may poll the interactive television program guide for polling information. The polling information may indicate, for example, whether user television equipment 22 is in use, the current channel user television equipment 22 is tuned to, the current programming rating, current program title, the status of remote access link 19 or communications paths 20, the available devices of user television equipment 22, or any other status related information.

Step 2300 may include substeps 2310 and 2320 for obtaining the polling information. At substep 2310, remote program guide access device 24 may obtain the polling information. Polling information may be obtained on startup, periodically, continuously, on demand in response to a suitable user command, or using any other suitable scheme. More particularly, status information may be obtained using SNMP (substep 2320), if desired. If SNMP is used to obtain polling informa-35 tion, for example, the access communications may include commands and protocol data units (PDUs). Other suitable network management protocols may also be used. At step 2330, remote program guide access device 24 may present the polling information to the user in any suitable method. The polling information may be displayed, for example, in a status display screen such as status display screen 200 of FIG. 11. Polling information may, for example, be output to the user via synthesized voice outputs that are played using a speaker and voice synthesis hardware and software.

FIG. 23 shows illustrative steps involved in providing the user with the opportunity to create messages and send them between the local interactive television program guide implemented on interactive television program guide equipment 17 and the remote access program guide. At step 2400, the user is provided with the opportunity to create a message. The user may create the message with the local interactive television program guide using, for example, user interface 46 of user television equipment 22 (FIG. 4), or the user may create the message using user interface 52 of remote program guide access device 24.

The message may include any suitable text, graphics, or audio. The user may, for example, speak an audio message into a microphone. The audio message may be digitized and stored in an access communication for transfer over remote access link 19. Alternatively, the user may input a text message using a suitable text input device (e.g., a keyboard). However the message is created and whatever its content, the message is transferred over remote access link 19 using one or more access communications. The message may be transferred from the interactive television program guide to the remote access program guide to the local interactive television program

guide, depending on where the message was created and its intended destination. At step 2410, the message may be presented to the user by user television equipment 22 (e.g., substep 2430), or by remote program guide access device 24 (e.g., substep 2440).

The discussion thus far has focused on implementing the invention with an interactive television program guide. The invention may also be applied to non-program-guide interactive television applications. Local non-program-guide applications run on user television equipment such as a set-top box and corresponding remote access non-program-guide application may run on a remote access device. Interactive television applications may be stand-alone applications, portions of an operating system, or any suitable combination thereof.

One non-program-guide application that may be imple- 15 mented on a set-top box in accordance with the present invention is an Internet browser. An Internet browser may have settings such as bookmarks, parental control settings, and general preferences that control how the browser functions. As shown in FIG. 24, a remote access device may provide the 20 user with access to a browser application by displaying, for example, browser screen 700 of a remote access browser application. Browser screen 799 may have a bookmark option 705. A user may, for example, select bookmark option 705 and add a bookmark (i.e., a record of the address of the current 25 web site that can be used to access the site). After the user adds a bookmark with a remote access Internet browser, the remote access Internet browser may exchange one or more access communications with a local Internet browser to add the bookmark to the local browser.

Another application that may be implemented or a set-top box in accordance with the present invention is a shopping application. A shopping application may have settings such as a default shipping address and credit card number. As shown in FIG. 25, a remote access shopping application screen 730 as may have settings such as a shipping address 720, and credit card number 725. A user may, for example, add a shipping address and credit card information. After a user adds shipping and credit card information with the remote access shopping application, the remote access application may exchange one or more access communications with a local shopping application to provide the information to the local application.

Another non-program-guide application that may be implemented on a set-top box and accessed via a remote 45 access device in accordance with the present invention is a stock ticker. A stock ticker may have settings such as settings indicating the top ten stocks in which the user is interested. As shown in FIG. 26, a remote access device may display a remote access stock ticker settings screen 710. Stock ticker 50 settings screen 710 may have, for example, ticker symbol 712 and a top ten stocks option 715. A user may, for example, add a top stock. By exchanging one or more access communications, the remote access stock ticker application can make the top ten stock settings effective on a local stock ticker application.

A chat application may be implemented on a set top box. Chat applications are services that allow users to exchange chat messages with other users in real time. A chat application may be implemented as a stand-alone chat application or as 60 part of another application such as a program guide application. Chat applications that may be implemented on user television equipment are described in DeWeese et al. U.S. patent application Ser. No. 09/356,270, filed Jul. 16, 1999, which is hereby incorporated by reference herein in its 65 entirety. A user may remotely adjust settings associated with a chat application such as the size of a chat window, an

28

address book, or whether to filter potentially offensive messages. After the user adjusts chat settings with a remote access chat application running on a remote access device, the remote access chat application may remotely adjust the settings of a local chat application by, for example, exchanging one or more access communications with the local chat application over a remote access link.

If desired, the settings of an e-mail application running on a set-top box may be adjusted remotely. Set-top based messaging systems are described, for example, in concurrently filed McKissick et al. U.S. patent application Ser. No. 09/356, 245, filed Jul. 16, 1999, which is hereby incorporated by reference herein in its entirety. Users may, for example, remotely add to or change an address book. When the user adjusts e-mail settings with a remote access e-mail application running on a remote access device, the remote access e-mail application may remotely adjust the settings of a local e-mail application by, for example, exchanging one ore more access communications with the local e-mail application over a remote access link.

The foregoing is merely illustrative of the principles of this invention and various modifications can be made by those skilled in the art without departing from the scope and spirit of the invention.

What is claimed is:

1. A method for accessing video programs over an Internet link, the method comprising:

receiving a plurality of video programs with user television equipment, wherein the user television equipment outputs to a first display device, and the user television equipment is located at user site;

providing the user with the opportunity to select a video program from the plurality of video programs over the Internet link using a remote access device, wherein:

the remote access device outputs to a second display device which is different from the first display device;

the remote access device is remote from the user television equipment; and the remote access device communicates with the user television equipment over the Internet link;

in response to receiving, at the user television equipment, a user selection of the video program from the remote access device over the Internet link, directing the user television equipment to access the video program; and

providing, from the user television equipment, the selected video program over the Internet link to the remote access device for output to the second display;

wherein providing the user with the opportunity to select a video program from the plurality of video programs over the Internet link using the remote access device further comprises:

receiving a generated television guide screen that identifies at least one video program;

providing the generated television guide screen to the remote access device over the Internet link; and

receiving a user selection of the at least one video program from the remote access device.

- 2. The method of claim 1, wherein directing the user television equipment to access the video program comprises directing the user television equipment to tune to channel of the video program.
- 3. The method of claim 1 further comprising displaying at least one video program listing on the remote access device for at least one of the plurality of video programs.
  - 4. The method of claim 1 further comprising: receiving a user request from the remote access device to view a different video program;

- in response to receiving the user request, directing the user television equipment to access the different video pro-
- providing the different video program over the Internet link to the remote access device.
- 5. The method of claim 4 wherein:
- receiving a user request to view a different video program comprises receiving a user request to view a different video program on a different channel;
- directing the user television equipment to access the different video program comprises directing the user television equipment to access the different video program on the different channel; and
- providing the different video program to the remote access 15 device comprises providing video of the different channel to the remote access device.
- **6**. The method of claim **1**, wherein the selected video program is a recorded video program.
- 7. The method of claim 1, wherein a remote access inter- 20 active program guide is implemented on the remote access device.
- 8. The method of claim 1, wherein a local interactive program guide is implemented on the user television equipment.
- and the second display device is in a different geographical location than the user television equipment and first display device.
- 10. A method for accessing a video program over an Internet link, the method comprising:
  - receiving, at a remote access device, a television guide screen generated by a user television equipment over the Internet link, wherein:
  - the user television equipment outputs to a first display device and the user television equipment is located at 35
  - the remote access device is remote from the user television equipment; and
  - the remote access device communicates with the user television equipment over the Internet link;
  - displaying on a second display device of the remote access device the television guide screen that is received from the user television equipment over the Internet link, wherein the second display device is different from the first display device;
  - receiving a user selection of a channel for viewing with a remote access device based on the television guide screen displayed on the second display device;
  - transmitting, from the remote access device, an instruction over the Internet link to the user television equipment to 50 tune to the selected channel;
  - receiving, at the remote access device, from the user television equipment video of the selected channel over the Internet link; and
  - displaying the video of the selected channel received from 55 the user television equipment over the Internet link on the second display device of the remote access device.
- 11. The method of claim 10, further comprising displaying at least one on-screen option for controlling the user television equipment over the Internet link.
- 12. The method of claim 11, wherein the at least one on-screen option comprises at least one of changing the selected channel, controlling the volume, and recorded video program playback options.
  - 13. The method of claim 10, further comprising: receiving a user selection to change the video of the currently selected channel with the remote access device;

30

- transmitting an instruction to the user television equipment to change the currently selected channel over the Inter-
- receiving video of a newly tuned channel with the remote access device; and
- displaying the video of the newly tuned channel with the remote access device.
- 14. The method of claim 13, wherein receiving a user selection to change the currently selected channel further comprises receiving a user selection of an on-screen option displayed on the remote access device to change the currently displayed video of the selected channel.
- 15. The method of claim 10, wherein the generated television guide screen comprises at least one selectable channel option.
- 16. The method of claim 15, wherein the at least one selectable channel option is displayed as a listing of channels.
- 17. The method of claim 16, wherein the listing of channels is a listing of favorite channels.
- 18. The method of claim 10, wherein the remote access device is one of a personal computer, a portable computer, a palmtop computer, a handheld personal computer, and a personal digital assistant.
- 19. The method of claim 10, wherein the video correspond-9. The method of claim 1, wherein the remote access device 25 ing to the selected channel is received by the user television equipment over a communication link different from the Internet link.
  - 20. The method of claim 19, wherein the communication link is a broadcast link, and the selected channel is one of a plurality of television channels broadcast by the communication link.
  - 21. A method for providing a video program to a remote access device over an Internet link, the method comprising:
    - providing, to a remote access device, a television guide screen generated by user television equipment over the Internet link, wherein:
    - the user television equipment outputs to a first display device and the user television equipment is located at
    - the remote access device is remote from the user television equipment; and the remote access device communicates with the user television equipment over the Internet link, wherein the remote access device outputs to a second display device which is different from the first display device:
    - receiving, at the remote access device, a user selection of a channel for viewing from the television guide screen being displayed on the second display device;
    - receiving, at the user television equipment, the user selection of a channel for viewing from the remote access device over the Internet link;
    - tuning the user television equipment to the selected channel; and
    - transmitting, from the user television equipment, video corresponding to the selected channel to the remote access device over the Internet link.
  - 22. The method of claim 21, wherein transmitting the video corresponding to the selected channel to the remote access device over the Internet link further comprises:
  - converting the video corresponding to the selected channel to a format suitable for transmission over the Internet link; and
  - transmitting the converted video to the remote access device over the Internet link.
  - 23. The method of claim 21, wherein providing a generated television guide screen from the user television equipment to the remote access device over the Internet link further com-

prises providing a generated television guide screen that comprises at least one on-screen option for controlling the user television equipment over the Internet link.

- **24**. The method of claim **23**, wherein the at least one on-screen option comprises at least one of changing the <sup>5</sup> selected channel, controlling volume, and recorded video program playback options.
  - 25. The method of claim 21, further comprising:
  - receiving a user selection from the remote access device to change the currently displayed video of the selected channel to a new channel;
  - tuning the user television equipment from the currently selected channel to the new channel; and
  - transmitting video of the new channel to the remote access  $$_{15}$$  device over the Internet link.
- 26. The method of claim 21, wherein the generated television guide screen comprises at least one selectable channel option.
- 27. The method of claim 26, wherein that at least selectable  $_{20}$  channel option is a channel icon.
- **28**. The method of claim **26**, wherein the at least one selectable channel option is displayed as a listing of channels.
- **29**. The method of claim **21**, wherein the remote access device is one of personal computer, a portable computer, a 25 palmtop computer, a handheld personal computer, and a personal digital assistant.
- **30**. A method for accessing a video program over an Internet link, the method comprising:
  - transmitting, with control circuitry to a remote access 30 device over an Internet link a video guide screen;
  - receiving, with the control circuitry from the remote access device over an Internet link, a user selection of the video program based on the video guide screen being displayed on a second display device, wherein:
  - the control circuitry is coupled to a device that outputs to a first display device and the remote access device outputs to a second display device which is different from the first display device, wherein the control circuitry and the device are located at user site;
  - the remote access device is remote from the control circuitry; and
  - the remote access device communicates with the control circuitry over the Internet link;
  - in response to receiving the user selection of the video 45 program with the control circuitry, directing the device to access the video program; and
  - transmitting the selected video program that is accessed to the remote access device over the Internet link for output to the second display device.
- **31**. A method for accessing a video program over an Internet link, the method comprising:
  - receiving, at a remote access device over the Internet link, a video guide screen generated using control circuitry, wherein:
  - the control circuitry is coupled to a device that outputs to a first display device, wherein the control circuitry and the device are located at user site;
  - the remote access device is remote from the control circuitry; and

60

- the remote access device communicates with the control circuitry over the Internet link;
- displaying on a second display device of the remote access device the video guide screen that is received from the control circuitry over the Internet link, wherein the second display device is different from the first display device;

32

- receiving a user selection of a channel for viewing with a remote access device based on the video guide screen being displayed on the second display device;
- transmitting, from the remote access device, an instruction over the Internet link to the control circuitry to tune to the selected channel in response to the user selection of a channel for viewing;
- receiving, at the remote access device from the control circuitry, video corresponding to the selected channel over the Internet link; and
- displaying the video corresponding to the selected channel on the second display device of the remote access device.
- **32**. A method for providing a video program to a remote access device over an Internet link, the method comprising:
  - transmitting, from control circuitry to a remote access device over the Internet link, a video guide screen generated by the control circuitry, wherein:
  - the control circuitry is coupled to a device that outputs to a first display device, wherein the control circuitry and the device are located at user site;
  - the remote access device is remote from the control circuitry:
  - the remote access device outputs to a second display device which is different from the first display device; and
  - the remote access device communicates with the control circuitry over the Internet link;
  - receiving, with the control circuitry over the Internet link, a user selection of a channel for viewing from the remote access device based on the video guide screen being displayed on the second display device;
  - using the control circuitry to tune to the selected channel; and
  - transmitting, over the Internet link, video corresponding to the selected channel from the control circuitry to the remote access device for display on the second display device.
- **33**. A method for accessing an interactive program guide 40 over an Internet link, the method comprising:
  - generating, with control circuitry, a first interactive program guide screen of the interactive program guide implemented using the control circuitry, for displaying a plurality of program identifiers, wherein the control circuitry is located at user site;
  - transmitting, over the Internet link, from the control circuitry to a remote access device the first interactive program guide screen for display on the remote access device, wherein:
  - the control circuitry is coupled to a first display device screen:
  - the remote access device outputs to a second display device which is different from the first display device; and
  - the remote access device communicates with the control circuitry over the Internet link;
  - receiving, with the control circuitry, a user command corresponding to a selection of a function of the interactive program guide over the Internet link from the remote access device based on the first interactive program guide screen;
  - in response to receiving the user command with the control circuitry from the remote access device, directing the control circuitry to generate a second interactive program guide screen corresponding to the selected function of the interactive program guide; and
  - transmitting, over the Internet link, from the control circuitry to the remote access device the second interactive

program guide screen for display on the second display device of the remote access device;

in response to receiving a selection of a video program from the second interactive program guide screen, instructing the control circuitry to access the selected video program; and

transmitting the accessed video program over the Internet link for display on the second display device.

**34.** A method for accessing an interactive program guide over an Internet link, comprising:

receiving, with a remote access device over the Internet link, a first interactive program guide screen of the interactive program guide implemented using control circuitry, wherein:

the first interactive program guide screen is generated using the control circuitry the control circuitry is coupled to a first display device, wherein the control circuitry is located at user site;

the remote access device communicates with the control circuitry over the Internet link; and

the remote access device outputs to a second display device 20 which is different from the first display device;

displaying, on the remote access device, the first interactive program guide screen received from the control circuitry over the Internet link;

receiving a user command over the Internet link corresponding to a selection of a function of the interactive program guide with the remote access device based on the first interactive program guide screen that is received from the control circuitry over the Internet link;

transmitting, from the remote access device, an instruction over the Internet link to the control circuitry to cause the control circuitry to generate a second interactive program guide screen of the interactive program guide corresponding to the selected function of the interactive program guide;

receiving, over the Internet link, the second interactive program guide screen with the remote access device from the control circuitry; and

displaying, on the second display device of the remote access device, the second interactive program guide 40 screen that is received from the control circuitry over the Internet link;

34

in response to receiving a selection of a video program from the second interactive program guide screen, instructing the control circuitry to access the selected video program; and

transmitting the accessed video program over the Internet link for display on the second display device.

**35**. A method for providing an interactive program guide to a remote access device over an Internet link, the method comprising:

transmitting, from control circuitry over the Internet link to the remote access device, a first interactive program guide screen of the interactive program guide implemented using the control circuitry, wherein the first interactive program guide screen is generated using the control circuitry, the control circuitry is located at user site, and wherein the remote access device communicates with the control circuitry over the Internet link;

receiving, with the control circuitry from the remote access device over the Internet link, a user command corresponding to a selection of a function of the interactive program guide based on the first interactive program guide screen, wherein the control circuitry is coupled to a first display device and the remote access device outputs to a second display device which is different from the first display device; and

in response to receiving the user command with the control circuitry, generating a second interactive program guide screen corresponding to the selected function of the interactive program guide; and

transmitting, from the control circuitry over the Internet link to the remote access device, the second interactive program guide screen for display on the second display device of the remote access device;

in response to receiving a selection of a video program from the second interactive program guide screen, instructing the control circuitry to access the selected video program; and

transmitting the accessed video program over the Internet link for display on the second display device.

### UNITED STATES PATENT AND TRADEMARK OFFICE

## **CERTIFICATE OF CORRECTION**

PATENT NO. : 7,913,278 B2

APPLICATION NO. : 11/820587

DATED : March 22, 2011

INVENTOR(S) : Michael D. Ellis et al.

It is certified that error appears in the above-identified patent and that said Letters Patent is hereby corrected as shown below:

Claim 12, column 29, line 63, after "controlling" delete "the".

Claim 33, column 32, line 50, change "device" to --device;--.

Claim 33, column 32, line 51, delete "screen;".

Signed and Sealed this Twenty-seventh Day of December, 2011

David J. Kappos

Director of the United States Patent and Trademark Office
