However, neither McGraw-Hill nor its authors guarantees the accuracy or completeness of any information published herein and neither McGraw-Hill nor its authors shall be responsible for any errors, omissions, or damages arising out of use of this information. This work is published with the understanding that McGraw-Hill and its authors are supplying information but are not attempting to render engineering or other professional services. If such services are required, the assistance of an appropriate professional should be sought.

And the final slope is found by Eq. 2.31a:

$$\begin{aligned}
 N'_2 u'_2 &= N'_1 u'_1 - y_2(N'_2 - N_2)c_2 \\
 &= - (N - 1)y_1 c_1 - y_1 \left[ 1 - \frac{(N - 1)}{N} t c_1 \right] (1 - N)c_2 \\
 (1.0)u'_2 &= u'_2 = - y_1(N - 1) \left[ c_1 - c_2 + t c_1 c_2 \frac{(N - 1)}{N} \right]
 \end{aligned}$$

Thus the power  $\phi$  (or reciprocal focal length) of the element is expressed as

$$\phi = \frac{1}{f} = \frac{-u'_2}{y_1} = (N - 1) \left[ c_1 - c_2 + t c_1 c_2 \frac{(N - 1)}{N} \right] \quad (2.36)$$

or, if we substitute  $c = 1/R$ ,

$$\phi = \frac{1}{f} = (N - 1) \left[ \frac{1}{R_1} - \frac{1}{R_2} + \frac{t(N - 1)}{R_1 R_2 N} \right] \quad (2.36a)$$

The back focal length can be found by dividing  $y_2$  by  $u'_2$  to get

$$\text{bfl} = \frac{-y_2}{u'_2} = f - \frac{ft(N - 1)}{NR_1} \quad (2.37)$$

The distance from the second surface to the second principal point is just the difference between the back focal length and the effective focal length (see Fig. 2.11); this is obviously the second term of Eq. 2.37.

The above procedure has located the second principal point and second focal point of the lens. The "first" points are found simply by substituting  $R_1$  for  $R_2$  and vice versa.

The focal points and principal points for several shapes of elements are diagramed in Fig. 2.12. Notice that the principal points of an equiconvex or equiconcave element are approximately evenly spaced within the element. In the plano forms, one principal point is at the curved surface, the other is about one-third of the way into the lens. In the meniscus forms shown, one of the principal points is completely outside the lens; in extreme meniscus shapes, both the principal points lie outside the lens and their order may be reversed from that shown. Note that the focal points of the negative elements are in reversed order compared to a positive element.

If the lens element is not immersed in air, we can derive a similar expression for it. Assuming that the object medium has an index of  $N_1$ , the lens index is  $N_2$ , and the image medium has an index of  $N_3$ ,
