Our Diet Impacts Our Health & Vitality

Leading global health authorities like the World Health Organization, Centers for Disease Control, American Heart Association, National Cancer Institute, and American Diabetes Association agree that the key to promoting health is eating a nutrient-rich diet that includes whole grains, fruits & vegetables, and fish.

- Almost 90% of Americans do not meet the vegetable intake recommendation, about 80% do not meet the recommendation for fruits.¹
- Ultra-processed foods make up 57% of calories consumed in the typical American diet.²
- 98% of Americans do not meet the recommendations for whole grains but most of us are exceeding the limits for refined grain intake.¹
- Protective lipids and sterols have been stripped from whole grains to increase their shelf life.
- Many don't eat fish due to concerns about the presence of heavy metals and contaminants.
- A majority of people are below the estimated average requirement for some basic, essential vitamins and minerals.

Good Nutrition Can Optimize Health

- Everyone should increase consumption of whole-grain foods, fruits and vegetables, and foods rich in omega-3 fatty acids—and maintain a healthy weight.
- But even those with good intentions to eat a healthy diet face challenges. Busy lifestyles, eating on-the-run, and the prevalence of processed foods all contribute towards nutritional gaps that would benefit from nutritional supplements.
